

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## Features

- Extremely wide input voltage ranges up to 150 VDC
- 4 outputs up to 60 V
- RoHS lead-free-solder and lead-solder-exempted products available.
- 5 year warranty for RoHS lead-free-solder products
- 1500 to 1800 VAC i/o electric strength test
- Electrical isolation between outputs
- Programmable input undervoltage lockout
- Shutdown/inhibit input
- Adjustable output voltages with flexible load distribution
- Frequency synchronization
- Outputs no-load, overload, and short-circuit proof
- Operating ambient temperature from  $-40$  to  $85$  °C
- Thermal protection
- Low profile: 10.5 mm or 8.9 mm with open frame
- Basic insulation
- Flexible output possibilities between 5 V and 60 V

Safety-approved to the latest edition of IEC/EN 60950-1 and UL/CSA 60950-1

## Description

The IMX35 Series of board-mountable, 35 Watt DC-DC converters has been designed according to the latest industry requirements and standards. The converters are particularly suitable for use in mobile or stationary applications in transport, railways, industry, or telecommunication, where variable input voltages or high transient voltages are prevalent.

Covering a total input voltage range from 9 V up to 150 V with 4 different models, the converters are available with up to four electrically isolated outputs from 5 V to 60 V, externally adjustable and with flexible load distribution. A shutdown input allows remote converter on/off. Features include consistently high efficiency over the entire input voltage range, high reliability, and excellent dynamic response to load and line changes.

The converters are designed and built according to the international safety standards IEC/EN/UL 60950, and approved by

CSA and Nemko. The converters provide basic insulation.

The circuit is comprised of 2 planar magnetics devices, and all components are automatically assembled and securely soldered onto a single PCB board without any wire connection. Magnetic feedback ensures maximum reliability and repeatability in the control loop over all operating conditions. Careful considerations of possible thermal stresses ensure the absence of hot spots providing long life in environments, where temperature cycles are present. The thermal design without using any potting material allows operation at full load up to an ambient temperature of  $71$  °C in free air and operation up to  $105$  °C with airflow. For extremely high vibration environments the case has holes for screw mounting.

## Product Marking

Converters without option Z are marked with type designation, input and output voltages and currents, applicable safety approval and recognition marks, company logo, production date, and serial no.

## Functional Description

The IMX35 converters are comprised of 2 feedback-controlled interleaved-switching flyback powertrains using current mode control.

Each converter consists of 4 electrically isolated outputs deriving from the 2 power trains. Vo1, Vo4 derive from the first powertrain and Vo2, Vo3 from the second one. Thus each pair of outputs is independent from the other one.

Voltage regulation for each pair of outputs is achieved with passive transformer feedback from the main transformer of the powertrain. Each pair of outputs has the same output voltage (i.e. D05, D12, etc.). If both powertrains have the same nominal

output voltage (e.g. D12D12), all outputs may be simultaneously adjusted by the Trim input (pin 5). In case of different output voltages (e.g. D05D 15), the Trim1 input influences only Vo1 and Vo4.

Current limitation is provided on the primary side for each powertrain and limits the possible output power for each pair of outputs. In the case of an overload on either of the powertrains, which causes the output voltage to fall to less than typically 70% of  $V_{o\ nom}$ , the entire converter shuts down and automatically restart in short intervals (hiccup mode).

The incorporated overtemperature protection shuts down the hole converter in the case of overtemperature and resumes automatically after cooling down.

Fig. 1  
Block diagram of quad-output models

## Electrical Input Data

General conditions:

$T_A = 25\text{ }^\circ\text{C}$ , unless specified

Pins 8 (shutdown or i), 6 (W), 5 (Trim or Trim1), and 1 (PUL) left open-circuit (not connected), unless specified.

Table 2: Input Data

Input			20IMX35			40IMX35			Unit
Characteristics		Conditions	min	typ	max	min	typ	max

<sup>1</sup>  $V_{i\text{ min}}$  will not be as stated, if  $V_o$  is increased above  $V_o\text{ nom}$  by use of Trim input. If the output voltage is set to a higher value,  $V_{i\text{ min}}$  will be proportionately increased.

<sup>2</sup> Input undervoltage lockout at typ. 85% of  $V_{i\text{ min}}$ .

<sup>3</sup> Measured with resistive and max. admissible capacitive load.

<sup>4</sup> Source impedance according to ETS 300132-2, version 4.3.

<sup>5</sup> 154 V during 2 s

<sup>6</sup> Revision BA or later. Older converters had  $f_s \leq 240$  kHz.

### Inrush Current

The inrush current has been kept as low as possible by choosing a very small input capacitance. A series resistor may be installed in the input line in order to further reduce this current.

Fig. 2  
 Typical inrush current at  $V_{i, nom}$ ,  $P_{o, nom}$  versus time (40IMX35).  
 Source impedance according to ETS 300132-2 at  $V_{i, nom}$ .

Fig. 3  
 Converter start-up and rise time (see table 2)

### Reverse Polarity Protection

The built-in suppressor diode also provides for reverse polarity protection at the input by conducting current in the reverse direction. An external fuse is required to limit this current.

Table 3: Recommended external fuses in the non-earthed input line

Converter model	Fuse type
20IMX35	F8.0A
40IMX35	F4.0A
70IMX35	F2.0A
110IMX35	F1.5A

### Input Transient Voltage Protection

A built-in suppressor diode provides effective protection against input transients, which may be generated for example by short-circuits across the input lines, where the network inductance may cause high energy pulses.

Table 4: Built-in transient voltage suppressor

Model	Breakdown voltage $V_{Br, nom}$ [V]	Peak power at 1 ms $P_p$ [W]	Peak pulse current $I_{pp}$ [A]
20IMX35	39	1500	22
40IMX35	100	1500	9.7
70IMX35	151	600	2.9
110IMX35	176	600	2.5

For very high energy transients as for example to achieve IEC/EN 61000-4-5 compliance (as per table *Electromagnetic Immunity*) an external inductor and capacitor are required. The components should have similar characteristics as listed in table below.

Table 5: Components for external circuitry for IEC/EN 61000-4-5, level 2

Model	Inductor (L)	Capacitor (C)	Diode (D)
20IMX35	22 $\mu$ H / 5 A	470 $\mu$ F / 40 V	1.5 kE47A
40IMX35	68 $\mu$ H / 2.7 A	2 x 100 $\mu$ F / 100 V	-
70IMX35	100 $\mu$ H / 1 A	2 x 82 $\mu$ F / 160 V	-
110IMX35	150 $\mu$ H / 0.8 A	2 x 82 $\mu$ F / 200 V	-

Fig. 4  
 Example for external circuitry to comply with IEC/EN 61000-4-5; the diode D is only necessary for 20IMX35 models.

## Electrical Output Data

General conditions:

- $T_A = 25\text{ °C}$ , unless  $T_C$  is specified
- Pins 8 (shutdown or i), 6 (W), 5 (Trim or Trim1), and 1 (PUL) left open-circuit (not connected), unless specified.

Table 6: Output data *per double-output powertrain* ( $V_{o1}/V_{o4}$  or  $V_{o2}/V_{o3}$ ; each power train has 2 outputs)

Output			2 x 5 V			2 x 12 V			2 x 15 V			Unit

<sup>1</sup> Both outputs of each powertrain connected in parallel. The current limit is primary side controlled. In the case of an overload condition, the thermal protection may cause the converter to shut down (automatic restart on cool-down).

<sup>2</sup> BW = 20 MHz, measured with an external capacitor of 1  $\mu\text{F}$  across the output pins.

<sup>3</sup> Measured with a probe according to EN 61204

<sup>4</sup> The output overvoltage protection is located on the primary side. It is not tracking the Trim/Trim1 control.

<sup>5</sup> Both outputs of each powertrain connected in parallel.

<sup>6</sup> Sum of capacities on the outputs of each powertrain.

### Thermal Considerations

If a converter, mounted on a PCB, is located in free, quasi-stationary air (convection cooling) at the indicated maximum ambient temperature  $T_{A \max}$  (see table *Temperature specifications*) and is operated at its nominal input voltage and output power, the case temperature  $T_C$  ( $T_{CZ}$  with option Z) measured at the measuring point of case temperature (see *Mechanical Data*) will approach the indicated value  $T_{C \max}$  after the warm-up phase. However, the relationship between  $T_A$  and  $T_C$  depends heavily on the conditions of operation and integration into a system. The thermal conditions are influenced by input voltage, output current, airflow, temperature of surrounding components and the surfaces and properties of the printed circuit board.  $T_{A \max}$  is therefore only an indicative value, and under practical operating conditions, the ambient temperature  $T_A$  may be higher or lower than this value.

**Caution:** The case temperature  $T_C$  (or  $T_{CZ}$ ) measured at the measuring point of case temperature (see *Mechanical Data*) may under no circumstances exceed the specified maximum value. The installer must ensure that under all operating conditions  $T_C$  (or  $T_{CZ}$ ) remains within the limits stated in the table *Temperature specifications*.

The converters provide the specified output power with free air convection cooling. In the upper temperature range the output power derating below should be observed.

Fig. 5  
 Maximum allowed output power versus ambient temperature (models with and without option Z)

### Overtemperature Protection

The converter is protected against possible overheating by means of an internal temperature monitoring circuit located on the primary side. It shuts down the converter above the internal temperature limit and attempts to restart automatically. This feature prevents excessive internal temperature building up which could occur under overload conditions.

### Short Circuit Behavior

The current limit characteristic shuts down the converter whenever a short circuit is applied to an output. It acts self-protecting and automatically recovers after removal of the overload condition (hiccup mode).

Fig. 6  
 Overload switch off (hiccup mode), typical values.

### Series and Parallel Connection

The outputs of one or several double-output powertrains may be connected in series respecting the current limitation.

Both outputs of the same powertrain can always be connected in parallel in will behave like a single output.

Several outputs of the same converter with equal output voltage (e.g. 5 V / 5 V) can be connected in parallel and will share their output currents almost equally.

If outputs of the same converter are being parallel and series-connected, it is recommended that outputs from the same powertrains are parallel-connected first. This applies for instance, if 24 V shall be generated by a converter with four 12 V outputs; see fig. 7.

Fig. 7  
 Generating 24 V with an IMX35D12D12-9

**Note:** Parallel operation of several converters may cause start-up problems. This becomes noticeable in applications, where one converter is not able to deliver the full resistive and capacitive load current alone, as it is required in true redundant systems.

**Typical Performance Curves**

General conditions:

- $T_A = 25^\circ\text{C}$ , unless  $T_C$  is specified.
- Shut down and Trim pin left open-circuit.

**Fig. 8**  
 $V_o$  versus  $I_o$  (typ.) of a double-output power train, with both outputs in parallel (e.g.,  $V_{o1/4}$  of a 40IMX35D12D12)

**Fig. 12**  
Efficiency versus input voltage and load. Typical values (40IMX35D12D12-8)

## Auxiliary Functions

### Adjustable Output Voltage

As a standard feature, the IMX35 offer adjustable output voltages in the range of 85 to 105% of  $V_{o\text{ nom}}$ . Fig. 12 shows the schematic diagram for the adjustment of quad-output models.

All models with equal output voltages have a Trim input at pin 5 referenced to the primary side, influencing all outputs simultaneously. Models with different output voltages exhibit a Trim1 input, influencing only the first power train ( $V_{o1}$  and  $V_{o4}$ ).

### Adjustment by means of an external resistor $R_{\text{ext}}$ :

Fig. 13

Output voltage control by means of the Trim input

Adjustment of the output voltage by means of an external resistor  $R_{\text{ext}}$  is possible within the range of 100 to 105% of  $V_{o\text{ nom}}$ .  $R_{\text{ext}}$  should be connected between Trim (pin 5) and  $V_{i-}$  (pin 2). The following table indicates suitable resistor values for typical output voltages under nominal conditions ( $V_{i\text{ nom}}$ ,  $I_o = 0.5 I_{o\text{ nom}}$ ).

**Note:** Connection of  $R_{\text{ext}}$  to  $V_{i+}$  may damage the converter.

Table 7:  $R_{\text{ext}}$  for  $V_o > V_{o\text{ nom}}$ ; approximate values ( $V_{i\text{ nom}}$ ,  $I_o = 0.5 I_{o\text{ nom}}$ )

$V_o$ [% $V_{o\text{ nom}}$ ]	$R_{\text{ext}}$ [k $\Omega$ ]	
	Trim	Trim1
105 to 108 (107 typically)	0	0
105	10	17
102	62	110
100	$\infty$	$\infty$

### Adjustment by means of an external voltage source $V_{\text{ext}}$

For external output voltage adjustment in the range 85 to 105% of  $V_{o\text{ nom}}$  a voltage source  $V_{\text{ext}}$  (0 to 20 V) is required, connected to Trim or Trim1 (pin 5) and  $V_{i-}$ . The table below indicates typical values  $V_o$  versus  $V_{\text{ext}}$ . Applying a control voltage of 15 to 20 V will set the converter into the hiccup mode. Direct paralleling of the Trim pins of converters of the same type connected in parallel is feasible.

Table 8:  $V_o$  versus  $V_{\text{ext}}$  for  $V_o = 85$  to 105%  $V_{o\text{ nom}}$ ; typical values ( $V_{i\text{ nom}}$ ,  $I_o = 0.5 I_{o\text{ nom}}$ )

$V_o$ [% $V_{o\text{ nom}}$ ]	$V_{\text{ext}}$ [V]	
	Trim [V]	Trim1 [V]
>105	0	0
102	1.8	1.5
100	2.5	2.5
95	4.3	4.25
90	6.2	6.2
85	8	8

### Synchronization (W)

It is possible to synchronize the switching frequency of one or more converters to an external clock signal.

This logic input W can be used to synchronize the oscillator to an external frequency source. This signal is edge-triggered with TTL thresholds and requires a source frequency of 490 to 540 kHz (duty cycle 10 to 90%). The external source frequency is internally divided by 2 to define the switching frequency of the converter. If unused, this pin can be connected to  $V_{i-}$  (pin 2) or left open-circuit.

### Reference Output (Ref)

The converter provides a stable 5 V ( $\pm 0.1$  V) reference signal on pin 7 (Ref). The output is protected by a 1 k $\Omega$  resistor. The signal may be used also in conjunction with the Trim input (pin 5) as a limited external voltage reference.

It is recommended to connect a filter capacitor (0.1  $\mu\text{F}$ ) between Ref and  $V_{i-}$ , if Ref is used.

### Shutdown

The outputs of the converters may be enabled or disabled by means of a logic signal (TTL, CMOS, etc.) applied to shutdown (pin 8). If the shutdown function is not required, pin 8 should be left open-circuit:

Converter operating:	2.0 to 20 V
Converter disabled:	-10 to +0.7 V

### Progr. Input Undervoltage Lockout PUL

A special feature of the converter (with Rev. BA or later) is the adjustable undervoltage lockout protection, which protects the converter (and the system) from high current caused by operation at low input voltages. This ensures easier start-up in distributed power systems.

The table below shows the band of switch on/off and the hysteresis.

Table 9: Trigger level and hysteresis (pin 1 left open)

Model	Trigger level	Hysteresis	Unit
20IMX35	7 to 8	<0.5	V
40IMX35	14 to 15.5	<1	
70IMX35	31 to 34	<3	
110IMX35	42 to 50	<8	

The undervoltage lockout levels may be programmed by using an external resistor  $R_{PUL}$  between PUL and  $V_{i-}$  to increase the preset levels as specified in table 10.

Table 10: Typical values for  $R_{PUL}$  and the respective lockout voltage for input voltage.

20IMX35		40IMX35	
$R_{PUL}$ [k $\Omega$ ]	$V_{i min}$ [V]	$R_{PUL}$ [k $\Omega$ ]	$V_{i min}$ [V]
$\infty$	$\leq 8$	$\infty$	$\leq 15.5$
39	10	43	22
19	12	16	26
13	14	10	28
9.1	16	0	32

70IMX35		110IMX35	
$R_{PUL}$ [k $\Omega$ ]	$V_{i min}$ [V]	$R_{PUL}$ [k $\Omega$ ]	$V_{i min}$ [V]
$\infty$	31	$\infty$	42
270	40	270	50
110	50	120	60
80	55	51	75

## Electromagnetic Compatibility (EMC)

A suppressor diode together with an input filter form an

effective protection against high input transient voltages which typically occur in many installations, but especially in battery-driven mobile applications.

## Electromagnetic Immunity

Table 11: Immunity type tests

Phenomenon	Standard	Class Level	Coupling mode <sup>1</sup>	Value applied	Waveform	Source imped.	Test procedure	In oper.	Perf. crit. <sup>2</sup>
Electrostatic discharge to case (not with opt. Z)	IEC/EN 61000-4-2	2 <sup>3</sup>	contact discharge (Trim pin open)	6000 V <sub>p</sub>	1/50 ns	330 Ω 150 pF	10 positive and 10 negative discharges	yes	B
Electromagnetic field	IEC/EN 61000-4-3	x <sup>4</sup>	antenna	20 V/m	80% AM, 1 kHz	n.a.	80 – 800 MHz	yes	A
		5	antenna	20 V/m			800 – 1000 MHz		
				10 V/m			1400 – 2100 MHz		
				5 V/m			2100 – 2500 MHz		
				3 V/m		5100 – 6000 MHz			
Electrical fast transients/burst	IEC/EN 61000-4-4	3 <sup>6</sup>	direct +i/-i	±2000 V <sub>p</sub>	bursts of 5/50 ns 5 kHz over 15 ms burst period, 300 ms	50 Ω	60 s positive, 60 s negative transients	yes	A
Surges	IEC/EN 61000-4-5	3 <sup>7</sup>	+i/-i	±1000 V <sub>p</sub>	1.2/50 μs	42 Ω 0.5 μF	5 pos. and 5 neg. surges	yes	A
RF Conducted immunity	IEC/EN 61000-4-6	3 <sup>8</sup>	+i/-i	10 VAC (140 dBμV)	AM modulated 80%, 1 kHz	50 Ω	0.15 to 80 MHz 150 Ω	yes	A

<sup>1</sup> i = input, o = output, c = case (not with option Z)

<sup>2</sup> A = normal operation, no deviation from specification, B = temporary deviation from specs. possible.

## Electromagnetic Emissions

Fig. 14

Typ. disturbances (quasi-peak and average) at the input according to EN 55011/22, measured at  $V_{i, nom}$  and  $I_{o, nom}$  (110IMX35D05D12-8 with input choke  $2 \times 1.1$  mH).

Conducted emission according to EN 55011, group 1, class A, can be achieved by adding filter. The filter components should be placed as close as possible to the input of the converter; see figure 15.

Table 12: Input filter components

Model	Common mode choke $L_1$ (Murata)	Ceramic cap $C_1$
20IMX35	70 $\mu$ H / 3.6 A, PLH10AN7003R6P2	4.7 $\mu$ F / 50 V
40IMX35	160 $\mu$ H / 2.1 A, PLH10AN1612R1P2	2.2 $\mu$ F / 100 V
70IMX35	290 $\mu$ H / 1.2 A, PLH10AN2911R2P2	1 $\mu$ F / 160 V

## Safety and Installation Instructions

### Pin allocation

Table 16: Pin allocation

Pin No.	Quadruple output
1	PUL
2	Vi-
3	n.c.
4	Vi+
5	Trim or Trim1
6	W
7	Ref
8	$\overline{SD}$ or i
11	Vo3-
12	Vo3+
13	Vo2+
14	Vo2-
15	Vo1-
16	Vo1+
17	Vo4+
18	Vo4-
19	n.c.

Fig. 18

Footprint. The holes in the PCB should have a diameter of 1.6 mm.

### Installation Instructions

Installation of the converters must strictly follow the national safety regulations in compliance with the enclosure, mounting, creepage, clearance, casualty, markings, and segregation requirements of the end-use application.

Connection to the system shall be made via a printed circuit board with hole diameters of 1.5 mm for the pins.

The converters should be connected to a secondary circuit.

Do not open the converter.

Ensure that a converter failure (e.g., by an internal short-circuit) does not result in a hazardous condition.

### Input Fuse

To prevent excessive current flowing through the input supply line in case of a short-circuit in the converter, an external fuse should be installed in the non-earthed input line. We recommend a fast acting fuse specified in table 3.

### Standards and Approvals

All converters are safety-approved to IEC/EN 60950-1 and UL/CSA 60950-1 2<sup>nd</sup> Ed.

The converters have been evaluated for:

- Building-in
- Basic insulation input to output, based on their maximum input voltage
- Pollution degree 2 (not option Z)
- Connecting the input to a secondary circuit, which is subject to a maximum transient rating of 1500 V.

The converters are subject to manufacturing surveillance in accordance with the above mentioned standards.

CB scheme is available.

### Railway Applications

To comply with Railway standards, all components are coated with a protective lacquer (except for option Z).

### Protection Degree and Cleaning Liquids

The protection degree is IP 30 (not for option Z). In order to avoid damage, any penetration of cleaning fluids should be prevented, since the converters are not hermetically sealed.

However, open-frame models (option Z) leave the factory unlacquered; they may be lacquered by the customer, for instance together with the mother board. Cleaning liquids are not permitted – except washing at room temperature with isopropyl alcohol and de-ionized/distilled water (1 : 1).

**Note:** Cleaning liquids can damage the adhesive joints of the ferrite cores.

### Isolation

The electric strength test is performed in the factory as a routine test in accordance with EN 50514 and EN 60950, and should not be repeated in the field. The Company will not honor any warranty claims resulting from electric strength field tests.

Table 17: Electric strength test voltages

Characteristic	Input to (outputs+case) 20/40IMX35 <sup>3</sup>	Input to (outputs+case) 70/110IMX35 <sup>3</sup>	Outputs to case all models <sup>3</sup>	Between outputs all models	Unit
Factory test >1 s	1.2 / 1.5 <sup>1</sup>	1.8	0.5	0.15 <sup>2</sup>	kVAC
Equivalent DC voltage	1.5 / 2.1 <sup>1</sup>	2.5	0.7	0.2 <sup>2</sup>	kVDC
Insulation resistance at 500 VDC	>100	>100	–	–	MΩ

<sup>1</sup> 1.5 kVAC according to IEC 60950, sect. 6.2, Telecom equipment; type test with 1.5 kVAC / 60 s (IEE 802.3). IMX35 units produced before 2013 were tested with 1.2 kVAC only.

<sup>2</sup> The test voltage between outputs is not applied as routine test.

<sup>3</sup> For open-frame models (option Z), only the insulation input to outputs is tested.

## Options

### i: Inhibit (Negative Shutdown Logic)

The outputs of the converter may be enabled or disabled by means of a logic signal (TTL, CMOS, etc.) applied to the inhibit pin 8. If the inhibit function is not required the inhibit (pin 8)

Fig. 19

If the inhibit pin is not used, connect it to Vi–.

should be connected to Vi– to enable the output (active low logic, fail safe).

Voltage at pin 8:

Converter operating:	–10 V to 0.8 V
Converter disabled:	2.4 V to 20 V or left open-circuit

### Z: Open Frame

For applications, where the protection by a housing is not necessary or in the case that the motherboard should be lacquered after fitting the converter.

**Note:** The converters shall not be exposed to cleaning processes, as this will damage the glue of the ferrite cores.

### G: RoHS-6

Converters with a type designation ending by G are RoHS-compliant for all six substances.

Non-G models are produced with leaded solder and are not RoHS-compliant. They are not preferred models.

NUCLEAR AND MEDICAL APPLICATIONS - These products are not designed or intended for use as critical components in life support systems, equipment used in hazardous environments, or nuclear control systems.

TECHNICAL REVISIONS - The appearance of products, including safety agency certifications pictured on labels, may change depending on the date manufactured. Specifications are subject to change without notice.
