Chipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

10BASE-T/100BASE-TX INTEGRATED PHYCEIVER WITH RMII INTERFACE   ICS1894-43

Description

The ICS1894-43 is a low-power, physical-layer device (PHY) that supports the ISO/IEC 10Base-T and 100Base-TX Carrier-Sense Multiple Access/Collision Detection (CSMA/CD) Ethernet standards, ISO/IEC 8802.3. It is intended for RMII, Node/Repeater applications and includes the Auto-MDIX feature that automatically corrects crossover errors in plant wiring.

The ICS1894-43 incorporates Digital-Signal Processing (DSP) control in its Physical-Medium Dependent (PMD) sub-layer. As a result, it can transmit and receive data on unshielded twisted-pair (UTP) category 5 cables with attenuation in excess of 24 dB at 100MHz.

The ICS1894-43 provides a Serial-Management Interface for exchanging command and status information with a Station-Management (STA) entity. The ICS1894-43 Media-Dependent Interface (MDI) can be configured to provide either half-duplex or full-duplex operation at data rates of 10 Mb/s or 100Mb/s.

In addition, the ICS1894-43 includes a programmable LED and interrupt output function. The LED outputs can be configured through registers to indicate the occurance of certain events such as LINK, ACTIVITY, etc. The purpose of the programmable interrupt output is to notify the PHY controller device immediately when a certain event happens instead of having the PHY controller continuously poll the PHY. The events that could be used to generate interrupts are: receiver error, Jabber, page received, parallel detect fault, link partner acknowledge, link status change, auto-negotiation complete, remote fault, etc.
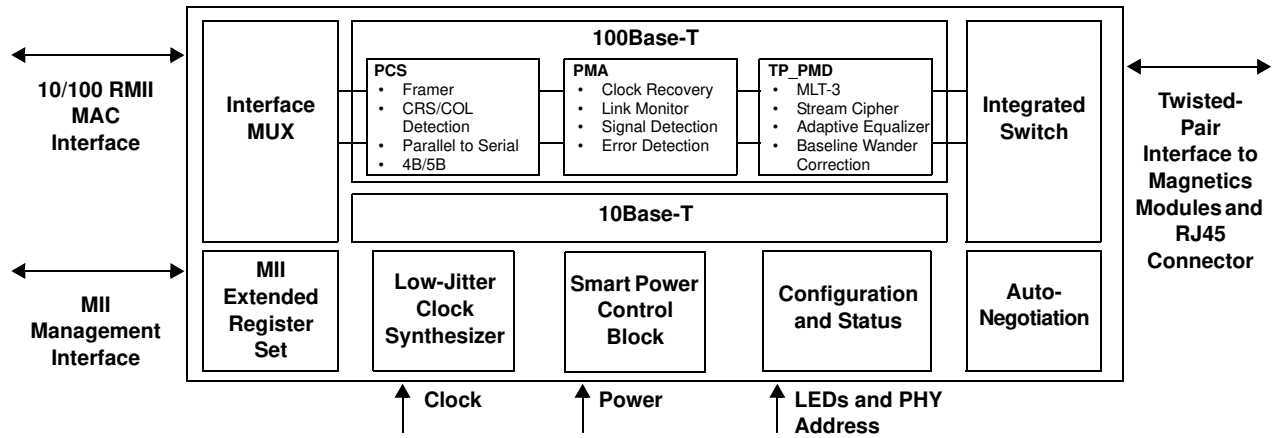

The ICS1894-43 has deep power modes that can result in significant power savings when the link is broken.

Applications: NIC cards, PC motherboards, switches, routers, DSL and cable modems, game machines, printers, network connected appliances, and industrial equipment.
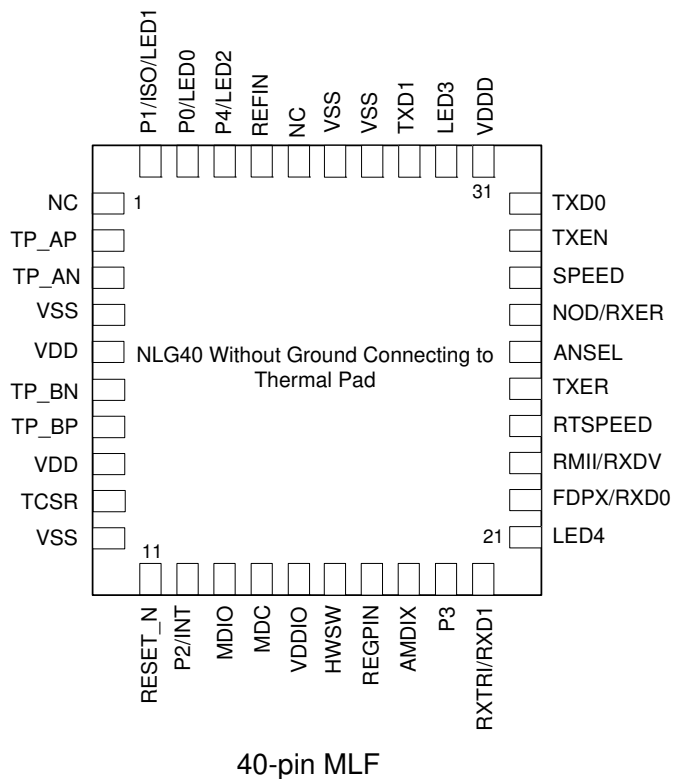

Features

- Supports category 5 cables and above with attenuation in excess of 24dB at 100 MHz.
- Single-chip, fully integrated PHY provides PCS, PMA, PMD, and AUTONEG sub layers functions of IEEE standard.
- 10Base-T and 100Base-TX IEEE 8802.3 compliant
- MIIM (MDC/MDIO) management bus for PHY register configuration
- RMII interface support with external 50 MHz system clock
- Single 3.3V power supply
- Highly configurable, supports:
    - Auto-Negotiation with Parallel detection
    - Node applications, managed or unmanaged
    - 10M or 100M full and half-duplex modes
- Auto-MDI/MDIX crossover correction
- Low-power CMOS (typically 300 mW)
- Power-Down mode (typically 21mW)
- Programmable LEDs
- Interrupt output pin
- Fully integrated, DSP-based PMD includes:
    - Adaptive equalization and baseline-wander correction
    - Transmit wave shaping and stream cipher scrambler
    - MLT-3 encoder and NRZ/NRZI encoder
- Core power supply (3.3 V)
- 3.3 V/1.8 V VDDIO operation supported
- Smart power control with deep power down feature
- Available in 40-pin (6mm x 6mm) QFN package, Pb-free
- Industrial Temp and Lead Free

Pin Descriptions

Pin Number	Pin Name	Pin Type	Pin Description
1	NC	—	No connect.
2	TP_AP	AIO	Twisted pair port A (for either transmit or receive) positive signal
3	TP_AN	AIO	Twisted pair port A (for either transmit or receive) negative signal
4	VSS	Ground	Connect to ground.
5	VDD	Power	3.3V Power Supply
6	TP_BN	AIO	Twisted pair port B (for either transmit or receive) negative signal
7	TP_BP	AIO	Twisted pair port B (for either transmit or receive) positive signal
8	VDD	Power	3.3V Power Supply
9	TCSR	AIO	Transmit Current bias pin, connected to Vdd and ground via two resistors.
10	VSS	Ground	Connect to ground.
11	RESET_N	Input	Hardware reset for the whole chip (active low)
12	P2/INT	IO/Ipd	PHY address Bit 2 as input (during power on reset and hardware reset) Interrupt output as output (default active low, can be programmed to active high)
13	MDIO	IO	Management Data Input/Output
14	MDC	Input	Management Data Clock
15	VDDIO	Power	3.3 V IO Power Supply.
16	HWSW	IO/Ipd	Hardware/Software control for phy speed as input (during power on reset and hardware reset).
17	REGPIN	IO/Ipd	Full register access enable as input (during power on reset and hardware reset).
18	AMDIX	IO/Ipu	AMDIX hardware enable as input (during power on reset and hardware reset).
19	P3	IO/Ipd	PHY address Bit 3 as input (during power on reset and hardware reset).
20	RXTRI/ RXD1	IO/Ipd	RX isolate enable (during power on reset and hardware reset) Received data Bit 1 as output in RMII mode.
21	LED4	IO/Ipd	LED #4 as output.
22	FDPX/ RXD0	IO/Ipu	Full duplex enable (during power on reset and hardware reset) Received data Bit 0 as output in RMII mode.
23	RMII/RXDV	IO/Ipd	RMII select as input (during power on reset and hardware reset). Connect this pin to VDDIO using a 1kΩ resistor. CRS_DV in RMII mode as output.
24	RTSPEED	Ipu	Real-time 10/100M input select. 1 = 100M mode, 0 = 10M mode.
25	TXER	IN	TXER Input
26	ANSEL	IO/Ipu	Auto-negotiation enable(during power on reset and hardware reset).
27	NOD/ RXER	IO/Ipd	Node/repeater select (during power on reset and hardware reset). Receive error as output in RMII mode.
28	SPEED	IO/Ipu	10M/100M select as input (during power on reset and hardware reset).
29	TXEN	Input	Transmit enable in RMII mode.
30	TXD0	Input	Transmit data Bit 0 in RMII mode.
31	VDDD	Power	Core Power Supply
32	LED3	IO/Ipu	LED3 output

Pin Number	Pin Name	Pin Type	Pin Description
33	TXD1	Input	Transmit data Bit 1 in RMII mode.
34	VSS	Ground	Connect to ground.
35	VSS	Ground	Connect to ground.
36	NC	—	No connect.
37	REF_IN	Input	50MHz clock input for RMII mode.
38	P4/LED2	IO/Ipu	PHY address Bit 4 as input (always latched high during power on reset and hardware reset) and LED # 2 as output
39	P0/LED0	IO	PHY address Bit 0 as input (during power on reset and hardware reset) and LED # 0(function configurable, default is "activity/no activity") as output
40	P1/ISO/LED1	IO	PHY address Bit 1 as input (during power on reset and hardware reset) and LED # 1 (function configurable, default is "10/100 mode") as output

Notes:

1. AIO: Analog input/output PAD.

   IO: Digital input/output.

   IN/Ipu: Digital input with internal 20k pull-up.

   IN/Ipd: Digital input with internal 20k pull-down.

   IO/Ipu: Digital input/output with internal 20k pull-up.

   IO/Ipd: Digital input/output with internal 20k pull-down.

2. RMII Rx Mode: The RXD[1:0] bits are synchronous with REFIN. For each clock period in which CRS_DV is asserted, two bits of recovered data are sent from the PHY to the MAC.

3. RMII Tx Mode: The TXD[1:0] bits are synchronous with REFIN. For each clock period in which TX_EN is asserted, two bits of data are received by the PHY from the MAC.

Strapping Options

Pin Number	Pin Name	Pin Type[1]	Pin Function
16	**HWSW**	IO/Ipd	Hardware pin select enable. Active during power-on and hardware reset.
17	**REGPIN**	IO/Ipd	Full register access enable. Active during power-on and hardware reset.
18	**AMDIX**	IO/Ipu	1 = AMDIX enable 0 = AMDIX disable
38	**P4**/LED2	IO/Ipu	The PHY address is set by P[4:0] at power-on reset. P0 and P1 must have external pull-up or pull-down to set address at start up.
19	**P3**	IO/Ipd	
12	**P2**/INT	IO/Ipd	
40	**P1/ISO/LED1**	IO	
39	**P0**/LED0	IO	
21	LED4	IO/Ipd	LED4 output.
20	**RXTRI**/RXD1	IO/Ipd	1=Realtime receiver isolation enable[2]; 0=RX output enable
22	**FDPX**/RXD0	IO/Ipu	1=Full duplex 0=Half duplex Ignored if Auto negotiation is enabled
23	**RMII/**RXDV	IO/Ipd	1=RMII mode 0=mode not supported
24	**RTSPEED**[3]	IO/Ipu	1=100M mode 0=10M mode
26	**ANSEL**	IO/Ipu	1=Enable auto negotiation 0=Disable auto negotiation
27	**NOD/**RXER	IO/Ipd	0=Node mode 1=repeater mode
28	**SPEED**[3]	IO/Ipu	1=100M mode 0=10M mode Ignored if Auto negotiation is enabled
32	**LED3**	IO/Ipu	LED3 output

1. IO/Ipu = Digital Input with internal 20k pull-up during power on reset/hardware reset; output pin otherwise.

2. If RXTRI/RXD1 pin is latched high during power on reset/hardware reset, P1/ISO/LED1 functions as RX real time isolation control input after latch and LED1 function will be disabled.

3. When Autonegotiation is enabled, the speed will be determined by the result of Autonegotiation between the link partners. When Autonegotiation is not enabled, the speed will be determined by the state of either a real-time pin (pin 24) or a register bit (00.13); whether pin 24 or Register00.13 is in control in this case is determined by register bit 19.14, which in turn has a latched-in default value from pin 16.

Application Schematic

Functional Description

The ICS1894-43 is an ethernet PHYceiver. During data transmission, it accepts sequential nibbles/di-bits from the MAC (Media Access Control), converts them into a serial bit stream, encodes them, and transmits them over the medium through an external isolation transformer. When receiving data, the ICS1894-43 converts and decodes a serial bit stream (acquired from an isolation transformer that interfaces with the medium) into sequential nibbles/di-bits. It subsequently presents these nibbles/di-bits to the MAC Interface.

The ICS1894-43 implements the OSI model's physical layer, consisting of the following, as defined by the ISO/IEC 8802-3 standard:

- Physical Coding sublayer (PCS)
- Physical Medium Attachment sublayer (PMA)
- Physical Medium Dependent sublayer (PMD)
- Auto-Negotiation sublayer

The ICS1894-43 is transparent to the next layer of the OSI model, the link layer. The link layer has two sublayers: the Logical Link Control sublayer and the MAC sublayer. The ICS1894-43 can interface directly with the MAC via RMII interface signals.

The ICS1894-43 transmits framed packets acquired from its MAC Interface and receives encapsulated packets from another PHY, which it translates and presents to its MAC Interface.

> **Note:** As per the ISO/IEC standard, the ICS1894-43 does not affect, nor is it affected by, the underlying structure of the MAC frame it is conveying.

100Base-TX Operation

During 100Base-TX data transmission, the ICS1894-43 accepts packets from the MAC and inserts Start-of-Stream Delimiters (SSDs) and End-of-Stream Delimiters (ESDs) into the data stream. The ICS1894-43 encapsulates each MAC frame, including the preamble, with an SSD and an ESD. As per the ISO/IEC Standard, the ICS1894-43 replaces the first octet of each MAC preamble with an SSD and appends an ESD to the end of each MAC frame.

When receiving data from the medium, the ICS1894-43 removes each SSD and replaces it with the pre-defined preamble pattern before presenting the data on the MAC Interface. When the ICS1894-43 encounters an ESD in the received data stream, signifying the end of the frame, it ends

the presentation of data on the MAC Interface. Therefore, the local MAC receives an unaltered copy of the transmitted frame sent by the remote MAC.

During periods when MAC frames are being neither transmitted nor received, the ICS1894-43 signals and detects the IDLE condition on the Link Segment. In the 100Base-TX mode, the ICS1894-43 transmit channel sends a continuous stream of scrambled ones to signify the IDLE condition. Similarly, the ICS1894-43 receive channel continually monitors its data stream and looks for a pattern of scrambled ones. The results of this signaling and monitoring provide the ICS1894-43 with the means to establish the integrity of the Link Segment between itself and its remote link partner and inform its Station Management Entity (SME) of the link status.

10Base-T Operation

During 10Base-T data transmission, the ICS1894-43 inserts only the IDL delimiter into the data stream. The ICS1894-43 appends the IDL delimiter to the end of each MAC frame. However, since the 10Base-T preamble already has a Start-of-Frame delimiter (SFD), it is not required that the ICS1894-43 insert an SSD-like delimiter.

When receiving data from the medium (such as a twisted-pair cable), the ICS1894-43 uses the preamble to synchronize its receive clock. When the ICS1894-43 receive clock establishes lock, it presents the preamble nibbles to the MAC Interface.

In 10M operations, during periods when MAC frames are being neither transmitted nor received, the ICS1894-43 signals and detects Normal Link Pulses. This action allows the integrity of the Link Segment with the remote link partner to be established and then reported to the ICS1894-43's SME.

Auto-Negotiation

The ICS1894-43 conforms to the auto-negotiation protocol, defined in Clause 28 of the IEEE 802.3u specification. Autonegotiation is enabled by either hardware pin strapping (pin 20) or software (register 0h bit 12).

Auto-negotiation allows link partners to select the highest common mode of operation. Link partners advertise their capabilities to each other, and then compare their own capabilities with those they received from their link partners. The highest speed and duplex setting that is common to the two link partners is selected as the mode of operation.

The following list shows the speed and duplex operation mode from highest to lowest.

- Priority 1: 100Base-TX, full-duplex
- Priority 2: 100Base-TX, half-duplex
- Priority 3: 10Base-T, full-duplex
- Priority 4: 10Base-T, half-duplex

If auto-negotiation is not supported or the ICS1894-43 link partner is forced to bypass auto-negotiation, the ICS1894-43 sets its operating mode by observing the signal at its receiver. This is known as parallel detection, and allows the ICS1894-43 to establish link by listening for a fixed signal protocol in the absence of auto-negotiation advertisement protocol.

MII Management (MIIM) Interface

The ICS1894-43 supports the IEEE 802.3 MII Management Interface, also known as the Management Data Input / Output (MDIO) Interface. This interface allows upper-layer devices to monitor and control the state of the ICS1894-43. An external device with MIIM capability is used to read the PHY status and/or configure the PHY settings. Additional details on the MIIM interface can be found in Clause 22.2.4.5 of the IEEE 802.3u Specification.

The MIIM interface consists of the following:

- A physical connection that incorporates the clock line (MDC) and the data line (MDIO).

- A specific protocol that operates across the aforementioned physical connection that allows an external controller to communicate with one or more ICS1894-43 devices. Each ICS1894-43 device is assigned a PHY address that is set by the P[4:0] strapping pins

- An internal addressable set of thirty-one 8-bit MDIO registers. Register [0:6] are required, and their functions are defined by the IEEE 802.3u Specification. The additional registers are provided for expanded functionality.

The following table shows the MII Management frame format for the ICS1894-43.

MII Management Frame Format

	Preamble	Start of Frame	Read/Write OP Code	PHY Address Bits [4:0]	REG Address Bits [4:0]	TA	Data Bits [15:0]	Idle
Read	32 1's	01	10	1AAAA	RRRRR	Z0	DDDDDDDD_DDDDDDDD	Z
Write	32 1's	01	01	00AAA	RRRRR	10	DDDDDDDD_DDDDDDDD	Z

Interrupt (INT)

P2/INT (pin 12) is an optional interrupt signal that is used to inform the external controller that there has been a status update in the ICS1894-43 PHY register. Register 23 shows the status of the various interrupts while register 22 controls the enabling/disabling of the interrupts.

MII Data Interface

The Media Independent Interface (MII) is specified in Clause 22 of the IEEE 802.3u Specification. It provides a common interface between physical layer and MAC layer devices, and has the following key characteristics:

- Supports 10Mbps and 100Mbps data rates.
- Uses a 25MHz reference clock, sourced by the PHY.
- Provides independent 4-bit wide (nibble) transmit and receive data paths.
- Contains two distinct groups of signals: one for transmission and the other for reception.

The ICS1894-43 is configured for MII mode upon power-up or hardware reset with the following:

- A 25MHz crystal connected to REFIN, REFOUT (pins 7, 36), or an external 25MHz clock source (oscillator) connected to REFIN

Reduced MII (RMII) Data Interface

The Reduced Media Independent Interface (RMII) specifies a low pin count Media Independent Interface (MII). It provides a common interface between physical layer and MAC layer devices, and has the following key characteristics:

- Supports 10Mbps and 100Mbps data rates.
- Uses a single 50MHz reference clock provided by the MAC or the system board.
- Provides independent 2-bit wide (di-bit) transmit and receive data paths.
- Contains two distinct groups of signals: one for transmission and the other for reception.

In RMII mode, a 50 MHz reference clock is connected to REFIN(pin 30).

RMII Signal Definition

The following table describes the RMII signals. Refer to RMII Specification for detailed information.

RMII Signal Name	Direction (with respect to PHY, ICS1894-43 signal)	Direction (with respect to MAC)	Description
REFIN	Input	Input or Output	Synchronous 50 MHz clock reference for receive, transmit and control interface
TXEN	Input	Output	Transmit Enable
TXD[1:0]	Input	Output	Transmit Data [1:0]
RXD[1:0	Output	Input	Receive Data [1:0]
RXER	Output	Input, or (not required)	Receive Error
CRS_DV[RXDV]	Output	Input	Carrier Sense/Data Valid

Reference Clock (REFIN)

REFIN is sourced by the MAC or system board. It is a continuous 50MHz clock that provides the timing reference for TX_EN, TXD[1:0], CRS_DV, RXD[1:0], and RX_ER.

Transmit Enable (TX_EN)

TX_EN indicates that the MAC is presenting di-bits on TXD[1:0] for transmission. It is asserted synchronously with the first nibble of the preamble and remains asserted while all di-bits to be transmitted are presented on the RMII, and is negated prior to the first REFIN following the final di-bit of a frame. TX_EN transitions synchronously with respect to REFIN.

Transmit Data [1:0] (TXD[1:0])

TXD[1:0] transitions synchronously with respect to REFIN. When TX_EN is asserted, TXD[1:0] are accepted for transmission by the PHY. TXD[1:0] is "00" to indicate idle when TX_EN is de-asserted. Values other than "00" on TXD[1:0] while TX_EN is de-asserted are ignored by the PHY.

Carrier Sense/Data Valid (CRS_DV[RXDV])

CRS_DV, identified as RXDV (pin 23), shall be asserted by the PHY when the receive medium is non-idle. The specifics of the definition of idle for 10BASE-T and 100BASE-X are contained in IEEE 802.3 [1] and IEEE 802.3u [2]. CRS_DV is asserted asynchronously on detection of carrier due to the criteria relevant to the operating mode. That is, in 10BASE-T mode, when squelch is passed or in 100BASE-X mode when 2 non-contiguous zeroes in 10 bits are detected carrier is said to be detected.

Loss of carrier shall result in the deassertion of CRS_DV synchronous to the cycle of REFIN which presents the first di-bit of a nibble onto RXD[1:0] (i.e. CRS_DV is deasserted only on nibble boundaries). If the PHY has additional bits to be presented on RXD[1:0] following the initial deassertion of CRS_DV, then the PHY shall assert CRS_DV on cycles of REFIN which present the second di-bit of each nibble and deassert CRS_DV on cycles of REFIN which present the first di-bit of a nibble. The result is: Starting on nibble boundaries CRS_DV toggles at 25 MHz in 100Mb/s mode and 2.5 MHz in 10Mb/s mode when the Carrier event ends before the RX_DV signal internal to the PHY is deasserted (i.e. the FIFO still has bits to transfer when the carrier event ends.) Therefore, the MAC can accurately recover RX_DV and the Carrier event end time. During a false carrier event, CRS_DV shall remain asserted for the duration of carrier activity.

The data on RXD[1:0] is considered valid once CRS_DV is asserted. However, since the assertion of CRS_DV is asynchronous relative to REFIN, the data on RXD[1:0] shall be "00" until proper receive signal decoding takes place (see definition of RXD[1:0] behavior).

*Note: CRS_DV is asserted asynchronously in order to minimize latency of control signals through the PHY.

Receive Data [1:0] (RXD[1:0])

RXD[1:0] transitions synchronously to REFIN. For each clock period in which CRS_DV is asserted, RXD[1:0] transfers two bits of recovered data from the PHY. RXD[1:0] is "00" to indicate idle when CRS_DV is de-asserted. Values other than "00" on RXD[1:0] while CRS_DV is de-asserted are ignored by the MAC.

Receive Error (RX_ER)

RX_ER is asserted for one or more REFIN periods to indicate that an error (e.g. a coding error or any error that a PHY is capable of detecting, and that may otherwise be undetectable by the MAC sub-layer) was detected somewhere in the frame presently being transferred from the PHY. RX_ER transitions synchronously with respect to REFIN. While CRS_DV is de-asserted, RX_ER has no effect on the MAC.

Auto-MDI/MDIX Crossover

The ICS1894-43 includes the auto-MDI/MDIX crossover feature. In a typical CAT 5 Ethernet installation the transmit twisted pair signal pins of the RJ45 connector are crossed over in the CAT 5 wiring to the partners receive twisted pair signal pins and receive twisted pair to the partners transmit twisted pair. This is usually accomplished in the wiring plant. Hubs generally wire the RJ45 connector crossed to accomplish the crossover. Two types of CAT 5 cables (straight and crossed) are available to achieve the correct connection. The Auto-MDI/MDIX feature automatically corrects for miss-wired installations by automatically swapping transmit and receive signal pairs at the PHY when no link results. Auto-MDI/MDIX is automatic, but may be disabled for test purposes by writing MDIO register 19 Bits 9:8 in the MDIO register. The Auto-MDI/MDIX function is independent of Auto-Negotiation and preceeds Auto-Negotiation when enabled.

Auto MDI/MDIX Table

AMDIX_EN (pin 18)	AMDIX_EN [Reg 19:9]	MDI_MODE [Reg 19:8]	Tx/Rx MDI Configuration
x	0	0	straight
x	0	1	cross
0	1	x	straight
1	1	x	straight/cross (auto select)
Default			
1	1	0	straight/cross (auto select)

Definitions:

straight　　transmit = TP_AP & TP_AN
　　　　　　　receive = TP_BP & TP_BN
cross　　　transmit = TP_BP & TP_BN
　　　　　　　receive = TP_AP & TP_AN
AMDIX_EN (Pin 18) AMDIX enable pin with 20 kOhm pull-up resistor
AMDIX_EN [19:9] MDIO register 19h bit 9
MDI_MODE [19:8] MDIO register 19h bit 8

Power Management

The ICS1894-43 supports a Deep Power Mode (DPD) that is enabled under the following conditions:

1. The Phy is not Receiving any signal from the partner (Link Down)

2. The MAC is not transmitting data to the Phy (TXEN Low)

Once the above conditions are met, the Phy goes into DPD mode after 32s (typical).

The logic internal to the device can be selectively shut down in DPD mode depending on Register 24 Bits 8-4.

Block Diagram of the Different Sections of the PHY as Affected by Register 24 bits
Clock Reference Interface

The REFIN pin provides the ICS1894-43 Clock Reference Interface. The ICS1894-43 requires a single clock reference with a frequency of 25 MHz ±50 parts per million. This accuracy is necessary to meet the interface requirements of the ISO/IEEE 8802-3 standard, specifically clauses 22.2.2.1 and 24.2.3.4. The ICS1894-43 supports two clock source configurations: a CMOS oscillator or a CMOS driver. The input to REFIN is CMOS (10% to 90% VDD), not TTL. Alternately, a 25MHz crystal may be used.

Crystal or Oscillator Connection
50 MHz Oscillator Specification table

Specifications	Symbol	Minimum	Typical	Maximum	Unit
Output Frequency	F0	49.9975	50.00000	50.0025	MHz
Freq. Stability (including aging)	ΔF/f			$\pm$50	ppm
Duty cycle CMOS level one-half VDD	Tw/T	35		65	%
VIH		2.79			Volts
VIL				0.33	Volts

Status Interface

The ICS1894-43 has five multi-function configuration pins that report the PHY status by providing signals that are intended for driving LEDs. Configuration is set by Bank0 Register 20.

Pins for Monitoring the Data Link table

Pin	LED Driven by the Pin's Output Signal
P0/LED0	Link, Activity, Tx, Rx, Mode, Dplx
P1/ISO/LED1	Link, Activity, Tx, Rx, Mode, Dplx
P4/LED2	Link, Activity, Tx, Rx, Mode, Dplx
LED3	Link, Activity, Tx, Rx, Mode, Dplx
LED4	Link, Activity, Tx, Rx, Mode, Dplx

Note:

1. During either power-on reset or hardware reset, each multi-function configuration pin is an input that is sampled when the ICS1894-43 exits the reset state. After sampling is complete, these pins are output pins that can drive status LEDs.

2. A software reset does not affect the state of a multi-function configuration pin. During a software reset, all multi-function configuration pins are outputs.

3. The P0/LED0 and P1/ISO/LED1 pins must be pulled either up or down with an external resistor to establish the address of the ICS1894-43. The P2/INT, P3/RXD2 and P4/LED2 pins have internal pull-up/ pull-down resistors. LEDs may be placed in series with these resistors to provide a designated status indicator as described in the *Pins for Monitoring the Data Link* table. Use 1KΩ resistors.

Caution: Pins listed in the *Pins for Monitoring the Data Link* table must not float.

4. As outputs, the asserted state of a multi-function configuration pin is the inverse of the sense sampled during reset. This inversion provides a signal that can illuminate an LED during an asserted state. For example, if a multi-function configuration pin is pulled down to ground through an LED and a current-limiting resistor, then the sampled sense of the input is low. To illuminate this LED for the asserted state, the output is driven high.

5. Adding 10KΩ resistors across the LEDs ensures the PHY address is fully defined during slow VDD power-ramp conditions.

The following figure shows typical biasing and LED connections for the ICS1894-43.
The above circuit decodes the PHY address = 17

Register Map

22.5	Interrupt Enable	Disable Page Received Interrupt	Enable Page Received Interrupt	RW		0	
22.4	Interrupt Enable	Disable Parallel Detect Fault Interrupt	Enable Parallel Detect Fault Interrupt	RW		0	
22.3	Interrupt Enable	Disable Link Partner Acknowledge Interrupt	Enable Link Partner Acknowledge Interrupt	RW		0	0
22.2	Interrupt Enable	Disable Link Down Interrupt	Enable Link Down Interrupt	RW		0	
22.1	Interrupt	Disable Remote Fault Interrupt	Enable Remote Fault Interrupt	RW		0	
22.0	Enable	Disable Link Up Interrupt	Enable Link Up Interrupt	RW		0	
Register 23 - Extended Control Register							
23.15:11	Reserved	Reserved		RO		0	0
23.10	Deep power down wake up Interrupt	Deep power down wake up did not occur	Deep power down wake up occurred	RO/SC		0	0
23.9	Deep power down Interrupt	Deep power down did not occur	Deep power down occurred	RO/SC		0	
23.8	Auto-Negotiation Interrupt	Auto-Negotiation Complete did not occur	Auto-Negotiation Complete occurred	RO/SC		0	
23.7	Jabber Interrupt	Jabber did not occur	Jabber occurred	RO/SC		0	0
23.6	Receive Error Interrupt	Receive Error did not occur	Receive Error occurred	RO/SC		0	
23.5	Page Receive Interrupt	Page Receive did not occur	Page Receive occurred	RO/SC		0	
23.4	Parallel Detect Fault Interrupt	Parallel Detect Fault did not occur	Parallel Detect Fault occurred	RO/SC		0	

Bit	Definition	When Bit = 0	When Bit = 1	Access [2]	SF[2]	Default[3]	Hex
23.3	Link Partner Acknowledge Interrupt	Link Partner Acknowledge did not occur	Link Partner Acknowledge occurred	RO/SC		0	0
23.2	Link Down Interrupt	Link Down did not occur	Link Down occurred	RO/SC		0	
23.1	Remote Fault Interrupt	Remote Fault did not occur	Remote Fault occurred	RO/SC		0	
23.0	Link Up Interrupt	Link Up did not occur	Link Up occurred	RO/SC		0	
Register 24 - Extended Control Register							
24.15:12	FIFO Half	RMII FIFO half full bits ((n+3)*2 bit), RMII		RW		2	2
24.11:9	Reserved	Reserved		RW		0	0
24.8	Deep Power down enable	Deep power down(DPD) disable	Deep power down(DPD) enable	RW		0	
24.7	Tpll10_100 DPD Enable	Don't power down 10/100 PLL in DPD mode	Controlled auto power down10/100 PLL in DPD mode	RW		0	0
24.6	RX 100 DPD Enable	Don't power down RX block in DPD mode	Controlled auto power down of RX block in DPD mode	RW		0	
24.5	Admix_TX DPD Enable	Don't power down admix_dac block in DPD mode	Control auto power down of admix_dac block in DPD mode	RW		0	
24.4	Cdr100_cdr DPD Enable	don't power down in DPD mod	Control auto power down of CDR block in DPD mode	RW		0	
24.3:0	Reserved	Reserved	Reserved			0	0
