

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

MINI-PS- 12- 24DC/48DC/0.7

Power supply unit

INTERFACE

Data sheet 104349 en 00

© PHOENIX CONTACT 2010-04-26

1 Description

The DC/DC converter converts the DC voltage of 12 V DC ... 24 V DC to an adjustable, controlled and electrically isolated 48 V DC output voltage.

Due to electrical isolation, the DC voltage circuits are electrically isolated from each other in a safe way. With a design width of only 22.5 mm, the housing is extremely slim.

Features

- Reliable power supply unit even at high ambient temperatures
- Reliable starting of heavy loads using the U/I characteristic curve
- Can be used worldwide in all industrial sectors due to a wide-range input and an international approval package
- High operating safety due to long mains buffering under full load and high MTBF (> 500,000 h)

DANGER OF EXPLOSION!

Only remove equipment when it is disconnected and not in the potentially explosive area.

DANGER

Components with dangerously high voltage and high stored energy are located in the device! Never carry out work on live parts!

Depending on the ambient temperature and the load, the housing can become very hot!

Make sure you always use the latest documentation.

It can be downloaded from the product at www.phoenixcontact.net/catalog.

7 Safety notes

DANGER OF EXPLOSION!

Only remove equipment when it is disconnected and not in the potentially explosive area.

DANGER

Components with dangerously high voltage and high stored energy are located in the device! Never carry out work on live parts!

Depending on the ambient temperature and the load, the housing can become very hot!

CAUTION

Before startup please ensure:

The mains connection has been carried out by a competent person and protection against electric shock is guaranteed!

The device can be disconnected outside the power supply unit in accordance with the regulations as in EN 60950 (e.g. through primary side line protection)!

All feed lines are sufficiently protected and dimensioned!

All output lines are dimensioned according to the maximum output current of the device or separately protected!

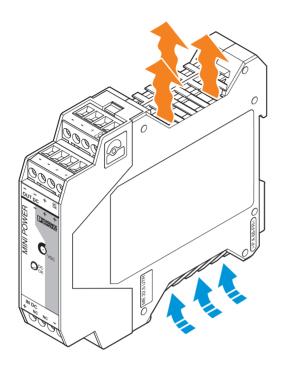

Sufficient convection must be guaranteed.

ATTENTION: Danger if used improperly

The power supply units are built-in devices. The device may only be installed and put into operation by qualified personnel. The corresponding national regulations must be observed.

8 Installation

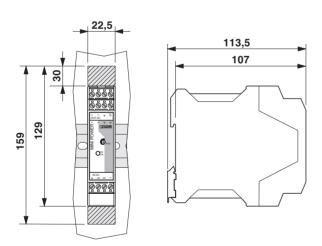

ATTENTION: Module can become damaged

To ensure sufficient convection, we recommend the following minimum spacing be used between modules: 5 cm above and below

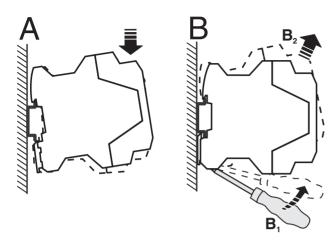

The power supply unit can be snapped onto all DIN rails in acc. with EN 60715.

9 Installation position

Mounting position: Installation depth 107 mm (+ DIN rail)

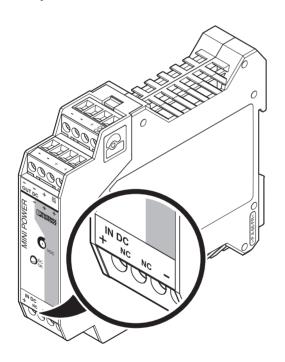

Assembly

Position the module with the DIN rail guide on the upper edge of the DIN rail, and snap it in with a downward motion.

Removing

Pull the snap lever open with the aid of a screwdriver and slide the module out at the lower edge of the DIN rail.

10 Input

ATTENTION: Module can become damaged

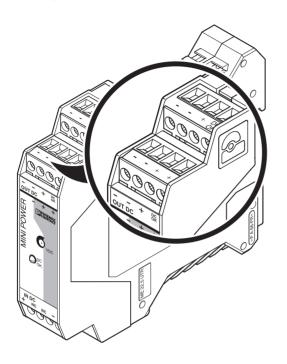

If an internal fuse is triggered, there is a device malfunction. In this case, the device must be inspected in the factory.

The 12 V DC \dots 24 V DC connection is established using the "+" and "-" screw connections.

Protection of the primary side

The device must be installed in acc. with the regulations as in EN 60950. An internal fuse is provided for device protection. Additional device protection is not required.

11 Output

ATTENTION: Module can become damaged

Make sure that all output lines are dimensioned according to the maximum output current or are separately protected. The cables on the secondary side must have sufficiently large cross sections in order to keep the voltage drops on the lines as low as possible.

The connection is established via screw connection terminal blocks "+" and "-" of the DC output. The output voltage can be adjusted on the potentiometer from 30 V DC ... 56 V DC.

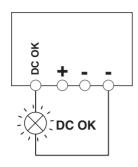

Protection of the secondary side

The device is electronically protected against short circuit and idling. In the event of a malfunction, the output voltage is limited to 60 V DC. Make sure that all output lines are dimensioned according to the maximum output current or are separately protected! The cables on the secondary side should have large cross sections in order to keep the voltage drops on the lines to a minimum.

12 Signaling

For function monitoring, there is the active DC OK switching output and the DC OK LED.

	State 1	State 2
"DC OK" LED	ON	OFF
Active DC OK switching output	U _{OUT} (with reference to "-")	U = 0 V (in reference to "-")
Meaning	Normal operation of the power supply unit. $U_{OUT} > 0.9 \times UN$	U _{OUT} ≤ 0.9 x UN Secondary load short-circuit or overload No mains voltage or device defective

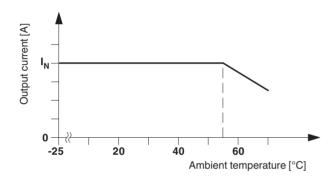

Active signal output

The DC output signal in normal operation of the power supply unit ($U_{OUT} > 0.9 \times U_{N}$) is between the "DC OK" and "-" connection terminal blocks and can carry a maximum of 20mA. By switching from "active high" to "low", the DC OK signal output signalizes when the output voltage is fallen short of by more than 10%.

The DC OK signal is decoupled from the power output. It is thus not possible for devices connected in parallel to act as an external power supply.

13 Function

Thermal behavior

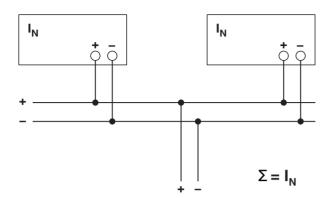

The device can supply a nominal output current of 0.7 A with ambient temperatures of up to 60°C. For ambient temperatures above 60°C, the output current must be reduced by 2.5% per Kelvin increase in temperature. From 70°C onwards or in the case of thermal overload, the device reduces the output capacity for its own protection, and returns to normal operation when it has cooled down.

Parallel operation

Devices of the same type can be connected in parallel to increase both redundancy and power. By default upon delivery, no further adjustments are required.

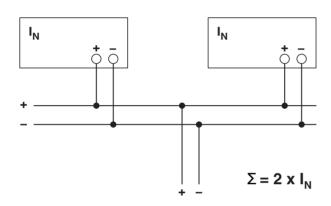

If the output voltage is adjusted, a uniform distribution of power is guaranteed by setting all parallel operated power supply units to exactly the same output voltage.

To ensure symmetrical current distribution we recommend that all cable connections from the power supply unit to the busbar are the same length and have the same cross section. Depending on the system, for parallel connection of more than two power supplies a protective circuit should be installed at each individual device output (e.g., decoupling diode, DC fuse or circuit breaker). This prevents high return currents in the event of a secondary device fault.

Redundant operation

Redundant circuits are suitable for supplying systems, which place particularly high demands on operational safety. If a fault occurs in the primary circuit of the first power supply unit, the second device automatically takes over the complete power supply without interruption, and vice versa. For this purpose, the power supply units to be connected in parallel must be large enough that the total current requirements of all loads can be fully met by one power supply unit. External decoupling diodes are required for 100% redundancy (ST 4-QUATTRO-DIO 1N 5408/L-R, Order No. 3037782, ST 4-QUATTRO-DIO 1N 5408/R-L, Order No. 3037795).

Increased performance

For n parallel connected devices, the output current can be increased to n x I_N . Parallel connection for increasing power is used when extending existing systems. A parallel connection is recommended if the power supply unit does not cover the current consumption of the most powerful load. Otherwise, the load should be divided between individual devices that are independent from one another.
