# imall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# **IB IL TEMP 4/8 RTD-EF-XC-PAC**

# Inline Modular analog input terminal, version for extreme conditions, 8 inputs, RTD

# Data sheet

8466\_en\_01

© PHOENIX CONTACT 2012-05-08

# 1 Function description

The terminal is designed for use within an Inline station. This terminal provides an 8-channel input module with three linear resistance ranges for resistance temperature detectors.

This terminal supports, for example:

- Platinum and nickel sensors, e.g., Pt100, Pt1000, Ni100, and Ni1000 according to the DIN IEC 60751 standard and to the SAMA RC 21-4-1966 guideline
- KTY81 and KTY84 sensors
- Cu10, Cu50, and Cu53 sensors
- Communication either via
- Parameter channel (PCP), all eight measuring channels, or
- Four process data words; always four channels (four 16-bit values) using the multiplex method

Thanks to special engineering measures and tests, the terminal can be used under extreme ambient conditions.

### Features

- Connection of eight RTD temperature sensors and linear resistors in 4-wire technology
- High precision and noise immunity
- Temperature stability
- High-resolution temperature and resistance measurement
- Resistance values (R<sub>0</sub>) can be preset separately using configuration bits
- Channels are configured independently of one another using the bus system.
- Configuration of open circuit detection sensitivity (firmware 1.10 or later)
- Additional representation in float format according to IEEE 754
- Diagnostic and status indicators
- Channel scout functionality, e.g., for optical channel identification during startup
- Can be used under extreme ambient conditions
- Painted PCBs
- Extended temperature range T2 (-40°C ... +55°C)

| 11                              | 200 ms      | 50 Hz and 60 Hz  | 69 dB  |

#### **Protective equipment**

| Transient protection |     |  |  |
|----------------------|-----|--|--|
| Measuring inputs     | Yes |  |  |
| Sensor supply        | Yes |  |  |
|                      |     |  |  |

#### Electrical isolation/isolation of the voltage areas

To provide electrical isolation between the logic level and the I/O area, it is necessary to supply the station bus coupler and the sensors connected to the analog input terminal described here from separate power supply units. Interconnection of the power supply units in the 24 V area is not permitted (see also IL SYS INST UM E user manual).

#### **Common potentials**

The 24 V main voltage, 24 V segment voltage, and GND have the same potential. FE is a separate potential area.

| Separate potentials in the system consisting of bus coupler/power terminal and I/O terminal |  |  |  |  |  |  |  |  |

# 4 Tolerance and temperature response

The percentage tolerance values refer to the respective positive measuring range final value. Unless stated otherwise, nominal operation (nominal voltage, preferred mounting position, default format, default filter setting, identical measuring range setting for channels) is used as the basis. The tolerance values refer to the operating temperature range specified in the tables. The operable range outside this range is not taken into consideration. Please also observe the values for temperature drift and the tolerances under influences of electromagnetic interference.

The maximum tolerance values represent the worst case measurement inaccuracy. They contain the theoretical maximum possible tolerances in the corresponding measuring ranges as well a the theoretical maximum possible tolerances of the calibration and test equipment.

| Tolerances (typical/maximum) at T <sub>A</sub> = +25°C |                |                       |          |                     |  |  |  |  |  |

| Linear resistance $R_{\text{Lin}}$ 30000 $\Omega$      | 0Ω             | 30000 Ω               | No data  | No data             | ± 3%   | No data, since this range is not cali-<br>brated |  |  |  |

The data contains the offset error, gain error, and linearity error in its respective setting (4-wire technology).

See separate table for additional temperature values and possible tolerances under EMI. All errors indicated as a percentage are related to the positive measuring range final value. The data is related to nominal operation (preferred mounting position,  $U_s = 24$  V, etc.) using 4-wire operation for RTD inputs. The maximum tolerance values represent the worst case measurement inaccuracy. They contain the theoretically maximum possible tolerances in the corresponding measuring ranges. The maximum tolerances of calibration and test equipment, which are theoretically possible, have also been taken into consideration. This data is valid for at least 24 months.

<sup>1)</sup> Specified separately, since the measuring range of ± 200°C is used for many applications.

<sup>2)</sup> In the more limited measuring range, the relative tolerance is also related to the measuring range final value of +200°C.

Temperature and drift response at  $T_A = -25^{\circ}C$  to  $+60^{\circ}C$ 

The above mentioned tolerances can be reduced by providing further shielding measures for the I/O module (e.g., use of a shielded control box/control cabinet). Please refer to the recommended measures in the IL SYS INST UM E Inline system manual.

i

Activation of the "open circuit detection sensitivity" (ODS) function is possible with firmware version 1.10 or later. When activating this function, please observe the "Notes on diagnostic behavior in the event of an error" on page 33.

# 5 Tested successfully: Use under extreme ambient conditions

The terminal has been tested successfully over 250 temperature change cycles in accordance with IEC 61131-2 in the range from  $-40^{\circ}$ C to  $+70^{\circ}$ C.

The following conditions were observed:

- The Inline devices for all connecting cables were connected with a minimum conductor cross section of 0.5 mm<sup>2</sup>
- The Inline station was installed on a wall-mounted horizontal DIN rail
- Fans were used to ensure continuous movement of air in the control cabinet
- The Inline station was not exposed to vibration or shock
- The Inline station was operated with a maximum of 24.5 V (ensured by using regulated power supply units)

# 8 Safety note

### WARNING: Electric shock

During configuration, ensure that no isolating voltage for safe isolation is specified between the analog inputs and the bus. During thermistor detection, for example, this means that the user has to provide signals with **safe isolation**, if applicable.

# 9 Installation instructions

High current flowing through potential jumpers  $U_M$  and  $U_S$  leads to a temperature rise in the potential jumpers and inside the terminal. To keep the current flowing through the potential jumpers of the analog terminals as low as possible, always place the analog terminals after all the other terminals at the end of the main circuit (for the sequence of the Inline terminals: see also IL SYS INST UM E user manual).

# 10 Electrical isolation

Figure 4 Electrical isolation of the individual function areas

# **11** Connection notes

**Always** connect temperature shunts using shielded, twisted-pair cables.

The connection examples show how to connect the shield (Figure 5).

Insulate the shield at the sensor.

Short-circuit unused channels (see Figure 5 on page 12, channel 4).

# 12 Connection examples

Connect the braided shield of the sensor cable **at one end** only.

For the assignments illustrated below, it is absolutely necessary to connect the cable shield at a central point in the control cabinet. The braided shield can be connected to a shield busbar using, for example, a shield connection clamp of SK8 type, Order No. 3025163.

# 12.1 4-wire connection

i

Figure 5 4-wire connection example

# Example assignment:

| Chan-<br>nel | Connection<br>method | Remark                           |
|--------------|----------------------|----------------------------------|
| 1            | 4-wire connection    |                                  |
| 28           | Not used             | Insert the short-circuit jumper. |

# 12.2 3-wire connection

#### Manufacturer recommendation

To improve the measured results of a 3-wire sensor on long sensor cables, Phoenix Contact recommends always combining 4-wire connection with the 3-wire sensor (see Figure 7 on page 13).

Figure 6 3-wire connection example

# 12.3 4-wire connection using a sensor in 3-wire technology

According to the assignment example illustrated below, RTD 3-wire sensors can also be used for long sensor cables with optimum accuracy using 4-wire connection of the terminal. This compensates for possible cable interferences, which may occur in conjunction with very long sensor cable lengths due to, for example, cable resistances, capacitances, and inductances. In addition, the temperature drift of the connection cable is eliminated.

4-wire connection exam
3-wire technology

# 12.4 2-wire connection

Figure 8 2-wire connection example

# 13 Process data

The module has five process data words. The first word is the control word, which is used to execute all actions. As confirmation for an action, the first input word contains a partial copy of the control word. The error bit indicates whether a command was carried out without errors. For the command codes 4x, 5x, and 60, a set error bit indicates an invalid configuration. For the commands used to read the measured values (command codes 00 ... 09), the error bit represents a group error message. If the error bit is set, there will be an error message on one or more channels.

The terminal has five process data words and one PCP word.

# 14 OUT process data words

Five process data output words are available.

Configure the terminal channels via the OUT process data words OUT1 and OUT2. In this context, the output word OUT1 contains the command and the output word OUT2 contains the parameters belonging to this command.

Configuration errors are indicated in the status word. The configuration settings are stored in a volatile memory.

If you change the configuration, the message "Measured value invalid" appears (diagnostics code 8004<sub>hex</sub>), until new measured values are available.

Please note that extended diagnostics is only possible if the IB IL format is configured as the format for representing the measured values. As this format is preset on the terminal, it is available as soon as the voltage is applied.

# 14.1 Output word OUT1 (control word)

|            |              | OUT1 |    |    |    |    |   |   |   |   |    |   |   |   |   |   |

firmed in the input words with the set error bit.

# 14.3 Parameters for configuration

The module can be configured either via process data or PCP. The error code "Measured value invalid" is output during configuration. If the configuration is invalid, the error bit is set in the status word. The configuration is only stored in a volatile memory. The first output word must contain the command, the second output word must contain the configuration value.

### EB: Error bit

EB = 0 No error has occurred.

EB = 1 An error has occurred.

# Mirroring of the command code:

A command code mirrored from the control word. Here, the MSB is suppressed.

#### 15.2 Input words IN2 to IN5

The measured values, the configuration or the firmware version are transmitted to the controller board or the PC using the process data input words IN2 to IN5 in accordance with the configuration.

For the control word **3C00<sub>hex</sub>**, IN2 supplies the firmware version and the module ID.

#### Example: firmware version 1.23:

|                     |                       | IN2 |    |    |    |    |   |   |   |   |   |   |      |        |     |   |
|---------------------|-----------------------|-----|----|----|----|----|---|---|---|---|---|---|------|--------|-----|---|

| Meaning             | Firmware version 1.23 |     |    |    |    |    |   |   |   |   |   |   | Modu | ule ID |     |   |

Basically two formats are available for the representation of the measured values. For more detailed information about the formats, please refer to "Formats for representing measured values" on page 20.

MSB Most significant bit

LSB Least significant bit

SB Sign bit

AV Analog value

# 16 Formats for representing measured values

# 16.1 IB IL format (default setting)

The measured value is represented in bits 14 to 0. An additional bit (bit 15) is available as a sign bit. This format supports extended diagnostics. Values >  $8000_{hex}$  and <  $8100_{hex}$  indicate an error.

Measured value representation in IB IL format, 15 bits

| MSB |    |    |    |    |    |   |     |         |      |   |   |   |   |   | LSB |

| FC18        | -1000      | -100.0            | -10.0          | -                 |                 | -                 | -               |
| 8080        | Underrange | < Limit value     | < Limit value  | -                 |                 | -                 | -               |

The following diagnostics codes are supported:

| Code (hex) | Error   |
|------------|---|
| 8001       | Overrange   |
| 8002       | Open circuit  |
| 8004       | Measured value invalid/no valid measured value available (e.g., because channel was not configured) |
| 8010       | Invalid configuration   |
| 8020       | I/O supply voltage fault  |
| 8040       | Terminal faulty   |
| 8080       | Underrange  |

If the measured value is outside the representation area of the process data, the "Overrange" or "Underrange" error message is displayed.

# 16.2 S7-compatible format

The measured value for temperature and resistance values is represented in bits 14 to 0. An additional bit (bit 15) is available as a sign bit.

Measured value representation in S7 format, 15 bits

| MSB |    |    |    |    |    |   |     |         |      |   |   |   |   |   | LSB |

| FFFF        | -1         | -0.1              | -0.01          | -            |               | -      | -            |
| FC18        | -1000      | -100.0            | -10.0          | -            |               | -      | -            |
| 8000        | Underrange | < Limit value     | < Limit value  | -            |               | -      | -            |

The following diagnostics codes are possible:

| Code (hex) | Error   |
|------------|---|
| 7FFF       | Overrange   |
| 8002       | Open circuit  |
| 8004       | Measured value invalid/no valid measured value available (e.g., because channel was not configured) |
| 8010       | Invalid configuration   |
| 8020       | I/O supply voltage fault  |
| 8040       | Terminal defective  |
| 8000       | Underrange  |

i

If the measured value is outside the representation area of the process data, the "Overrange" or "Underrange" error message is displayed.

# 17 PCP communication

1

For information on PCP communication, please refer to the IBS SYS PCP G4 UM E (Order No. 2745169) and IBS PCP COMPACT UM E (Order No. 9015349) user manuals.

When the terminal is delivered, it is configured according to the default settings. To adapt the configuration, the terminal can be configured via process data or PCP.

In PCP mode, the terminal is configured with the "Config Table" object.

The IBS CMD (for standard controller boards) and PC WORX (for Field Controllers (FC) and Remote Field Controllers (RFC)) programs are available for the configuration and parameterization of your INTERBUS system. For additional information, please refer to the IBS CMD SWT G4 UM E user manual and the documentation for the version of PC WORX used.

# 18.4 Measured Value Float object (0082<sub>hex</sub>)

1

This format provides the highest internal module accuracy and is independent of the configured resolution.

#### **Object description:**

| Object         | Measured Value Float   |             |  |  |  |
|----------------|--|-------------|--|--|--|
| Access         | Read   | Read        |  |  |  |
| Data type      | Array of Rec   | 8 x 6 bytes |  |  |  |
| Index          | 0082 <sub>hex</sub>  |             |  |  |  |
| Subindex       | 01_hexAnalog value of channel 102_hexAnalog value of channel 203_hexAnalog value of channel 304_hexAnalog value of channel 405_hexAnalog value of channel 506_hexAnalog value of channel 607_hexAnalog value of channel 708_hexAnalog value of channel 8 |             |  |  |  |
| Length (bytes) | 30_hexSubindex 00_hex06_hexSubindex 01_hex to 08_hex   |             |  |  |  |
| Data           | Analog values of the channels  |             |  |  |  |

The extended float format is a specific format from Phoenix Contact and consists of the measured value, the status and the unit code. The status is required as there are no patterns informing about the status of the value defined in the float format. The status corresponds to the lower bytes of the Inline error code.

For example, if status = 01 with overrange, the Inline error code is 8001<sub>hex</sub>. The measured value is valid if status=0.

#### Measured value record:

| Element | Data type  | Length in bytes | Meaning  |
|---------|------------|-----------------|--|
| .1      | Float      | 4               | Measured value in float format according to IEEE 754 |
| .2      | Unsigned 8 | 1               | Status   |
| .3      | Unsigned 8 | 1               | Unit code: 32: °C, 33: °F, 37: Ω                     |

#### Structure of the float format according to IEEE 754

| Bit        |      | 25   |      | 17   |      | 9    |      | 1    |
|------------|------|------|------|------|------|------|------|------|
| Assignment | VEEE | EEEE | EMMM | MMMM | MMMM | MMMM | MMMM | MMMM |

S = 1 sign bit, 0: positive, 1: negative

E = 8 bits, exponent with offset 7Fh<sub>hex</sub>

M = 23 bits, mantissa

#### Example values for the float format

| 1.0        | 3F 80 00 00 <sub>hex</sub> |
|------------|----------------------------|
| -1.0       | BF 80 00 00 <sub>hex</sub> |
| 10         | 41 20 00 00 <sub>hex</sub> |
| 1.03965528 | 3F 85 13 6D <sub>hex</sub> |
