Product description

The digital Inline output terminals are designed for the connection of digital actuators, such as electromagnetic valves, contactors or visual indicators.

All the typical applications are covered by the standard automation terminals.

The I/O equipment is connected by a simple or an extended Inline connector, depending on the number of channels. The multi-wire connection method is available in both cases.

The Inline terminals can be labeled using hinged labeling fields. The fields have insert cards that can be labeled individually to suit the application. Additionally, there is the proven ZBFM-6... Zack strip for labeling the terminal points.

FAQs

- **Can I connect outputs in parallel to increase the output current, and must I pay attention to anything special?**

It is generally possible to connect the outputs in parallel. Please ensure that - Both outputs are connected to the same supply voltage in the same segment - Both outputs are always switched simultaneously - The maximum power to switch off an inductive load does not increase. The value for an individual channel (150 mJ at $I_{nom} = 0.5$ A and 2.4 J at 2 A) applies when several channels are connected in parallel
