

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# Integrated Transceiver Modules for WLAN 802.11 b/g/n, Bluetooth, Bluetooth Low Energy (BLE), and ANT

## FEATURES

- IEEE 802.11b,g,n,d,e,i compliant
- Typical WLAN Transmit Power:
  - 20.0dBm, 11 Mbps,CCK (b)
  - 14.5dBm, 54 Mbps,OFDM (g)
  - 12.5dBm, 65 Mbps,OFDM (n)
- Typical WLAN Sensitivity:
  - -89dBm, 8% PER, 11 Mbps
  - -76dBm, 10% PER, 54 Mbps
  - -73dBm, 10% PER, 65 Mbps
- Bluetooth 2.1+EDR, Power Class 1.5
- Full support for BLE 4.0 and ANT
- Miniature footprint: 18 mm x 13 mm
- Low height profile: 1.9 mm
- U.FL connector for external antenna
- Terminal for PCB/Chip antenna feeds
- Integrated band-pass filter
- Worldwide acceptance: FCC (USA), IC (Canada), ETSI (Europe), Giteki (Japan)
- Modular certification allows reuse of LSR FCC ID and ETSI certification without repeating the expensive testing on your end product
- Compact design based on Texas Instruments WL1271L Transceiver
- Seamless integration with TI OMAP™ application processors
- SDIO Host data path interfaces
- Bluetooth Advanced Audio Interfaces
- Low power operation mode
- RoHS compliant

## DESCRIPTION

The TiWi-BLE module is a high performance 2.4 GHz IEEE 802.11 b/g/n, Bluetooth 2.1+EDR, and Bluetooth Low Energy (BLE) 4.0 radio in a cost effective, pre-certified footprint.

The module realizes the necessary PHY/MAC layers to support WLAN applications in conjunction with a host processor over a SDIO interface.

The module also provides a Bluetooth platform through the HCI transport layer. Both WLAN and Bluetooth share the same antenna port.

Need to get to market quickly? Not an expert in 802.11 or Bluetooth? Need a custom antenna? Would you like to own the design? Would you like a custom design? Not quite sure what you need? Do you need help with your host board? LSR Design Services will be happy to develop custom hardware or software, integrate the design, or license the design so you can manufacture yourself. Contact us at [sales@lsr.com](mailto:sales@lsr.com) or call us at 262-375-4400.

## APPLICATIONS

- Security
- HVAC Control, Smart Energy
- Sensor Networks
- Medical

# TIWI-BLE MODULE FOOTPRINT AND PIN DEFINITIONS

To apply the TiWi-BLE module, it is important to use the module pins in your application as they are designated in below and in the corresponding pin definition table found on pages 8 and 9. Not all the pins on the TiWi-BLE module may be used, as some are reserved for future functionality.

(\*) indicates that pin is capable of bidirectional operation, but is used as the type shown.

**Table 3 TiWi-BLE Module Pin Descriptions**

**All digital I/O signals use 1.8V logic. If the host microcontroller does not support 1.8V logic, then level shifters MUST be used.**

### **BT\_FUNC2 and BT\_FUNC5 Pins**

When BT is awake and active, BT\_WU (BT\_FUNC2) is high (from host to module). This is an active high signal. The host puts the BT section to sleep by de-asserting (logic low level) the BT\_WU signal (input to the module). The module then drives HOST\_WU (BT\_FUNC5) low to acknowledge to the host that it has been put into sleep mode.

Using these pins is optional.

### **BT\_FUNC4 Pin**

The BT\_FUNC4 (BT\_UARTD) pin is a debug pin. It is a 1.8V logic UART TX line. This pin should never need to be used in normal operation. It may be useful to terminate this pin to a test point or header in case it is needed.

### **WL\_UART\_DBG Pin**

The WL\_UART\_DBG pin is a debug pin. It is a 1.8V logic UART TX line. This pin should never need to be used in normal operation. It may be useful to terminate this pin to a test point or header in case it is needed.

### **WL\_RS232\_RX and WL\_RS232\_TX Pins**

These pins are used for a WLAN test mode interface. Both pins are 1.8V logic level UART pins. These pins should be brought out to a header on the host PCB. The WLAN test interface can be used to place the module into constant packet transmit and constant packet receive modes. These modes can be useful for antenna and sensitivity testing.

## INI FILE RADIO PARAMETERS

There is an ini file that contains WLAN radio parameters which are critical to both the RF performance and EMC compliance of the module.

The ini file available on the LSR website is only intended to be used with the LSR WLAN Eval Tool. Note that this ini file will not work when using the TiWi-BLE module in normal operation which typically involves an operating system. To use the TiWi-BLE module in normal operation, refer to specifics contained in the TiWi Family INI File Radio Parameter User Guide which is also available for download on the LSR website.

The settings specified in the appropriate ini file must be used to operate the module in compliance with the modular certification for FCC or ETSI. There is a unique ini file for operating the module in compliance with FCC regulations, and a different ini file for operating the module in compliance with the ETSI regulations.

## ELECTRICAL SPECIFICATIONS

The majority of these characteristics are based on controlling and conditioning the tests using the TiWi-BLE control software application. Other control conditions may require these values to be re-characterized by the customer.

### Absolute Maximum Ratings

Parameter	Min	Max	Unit
Power supply voltage (VBAT) <sup>(4)(5)</sup>	-0.5	+5.5	V
Digital supply voltage (VIO)	-0.5	2.1	V
Voltage on any GPIO	-0.5	VIO + 0.5	V
Voltage on any Analog Pins <sup>(3)</sup>	-0.5	2.1	V
RF input power, antenna port		+10	dBm
Operating temperature <sup>(6)</sup>	-40	+85	°C
Storage temperature	-55	+125	°C

1. Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device and are not covered by the warranty. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
2. All parameters are measured as follows unless stated otherwise: VDD\_IN=1.8V, VDDIO\_1.8V=1.8V, VDD\_LDO\_CLASS1P5=3.6V
3. Analog pins: XTALP, XTALM, RFIOBT, DRPWXB, DRPWRXB, DRPWTXB, and also FMRFINP, FMRFINM, FMRFINM, FMAUDLIN, FMAUDRIN, FMAUDLOUT, FMAUDROUT
4. The following signals are from the VBAT group, PMS\_VBAT and VDD\_LDO\_CLASS1P5 (if BT class 1.5 direct VBAT is used).
5. Maximum allowed depends on accumulated time at that voltage; 4.8V for 7 years lifetime, 5.5V for 6 hours cumulative.
6. The device can be reliably operated for 5,000 active-WLAN cumulative hours at T<sub>A</sub> of 85°C.

## WLAN POWER-UP SEQUENCE

The following sequence describes device power-up from shutdown. Only the WLAN Core is enabled; the Bluetooth and FM cores are disabled.

**Figure 3 TiWi-BLE Power-up Sequence Requirements**

1. No signals are allowed on the IO pins if no IO power is supplied, because the IOs are not 'failsafe'. Exceptions are CLK\_REQ\_OUT, SLOWCLK, XTALP, and AUD\_xxx, which are failsafe and can tolerate external voltages with no VDDS and DC2DC".
2. VBAT, VIO, and SLOWCLK must be available before WL\_EN.
3.  $T_{\text{wakeup}} = T_1 + T_2$

The duration of T1 is defined as the time from WL\_EN=high until Fref is valid for the SoC.  $T_1 = \sim 55\text{ms}$

The duration of T2 depends on:

Operating system

- Host enumeration for the SDIO/WSPI

- PLL configuration

## WLAN POWER-DOWN SEQUENCE

Notes:

1. The DC2DC(1.8V) signal can be monitored on BT\_FUNC2 Module Pin (#41)
2. DC\_REQ and CLK\_REQ are internal signals shown for reference only

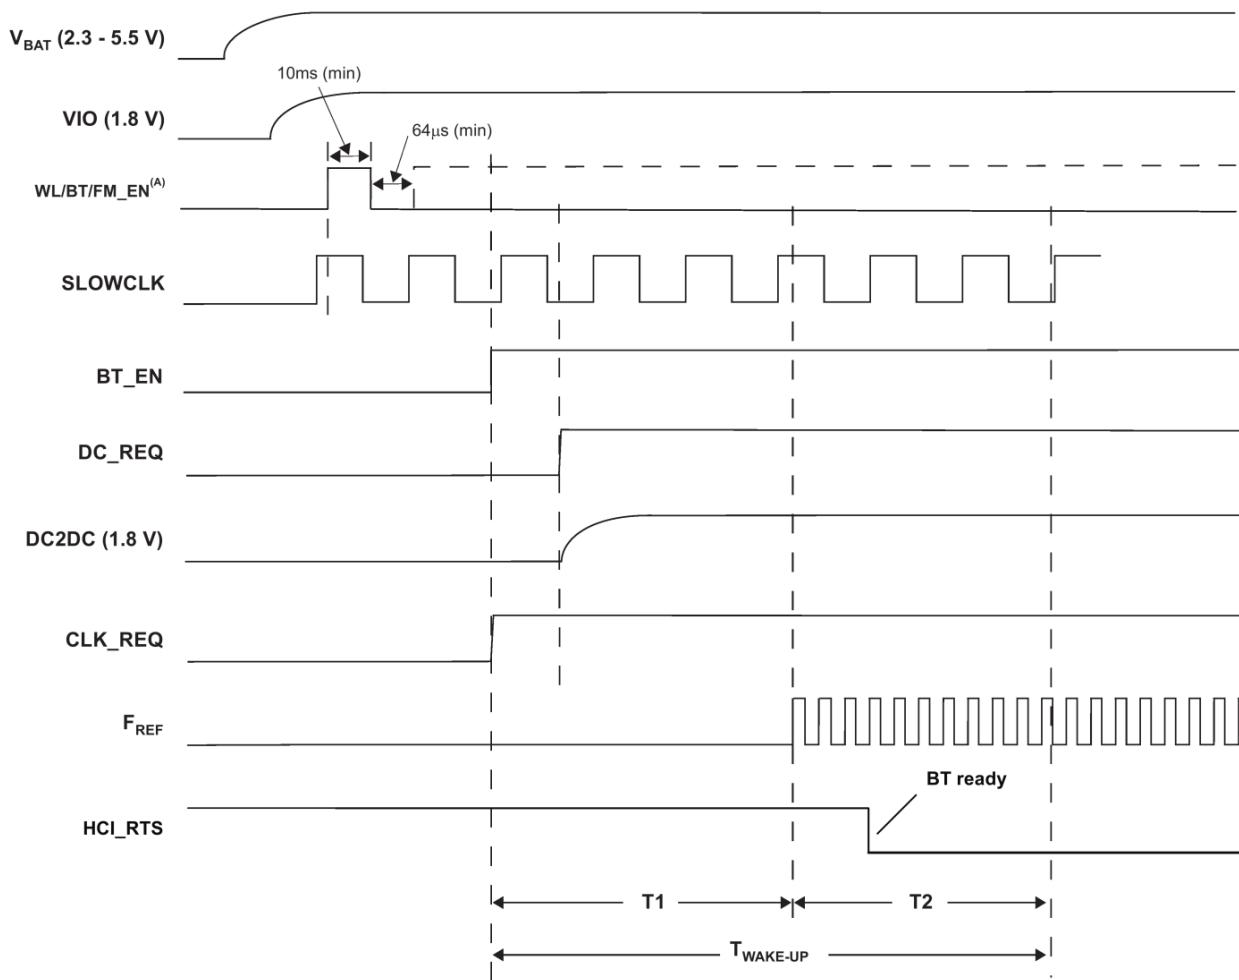

**Figure 4 TiWi-BLE Module Power-down Sequence Requirements**

1. DC\_REQ will go low only if WLAN is the only core working. Otherwise if another core is working (e.g BT) it will stay high.
2. CLK\_REQ will go low only if WLAN is the only core working. Otherwise if another core is working and using the F<sub>REF</sub> (e.g BT) it will stay high.
3. If WLAN is the only core that is operating, WL\_EN must remain de-asserted for at least 64μsec before it is re-asserted.

## BLUETOOTH POWER-UP SEQUENCE

The following sequence describes device power up from shutdown. Only the Bluetooth core is enabled; the WLAN core is disabled.

Notes:

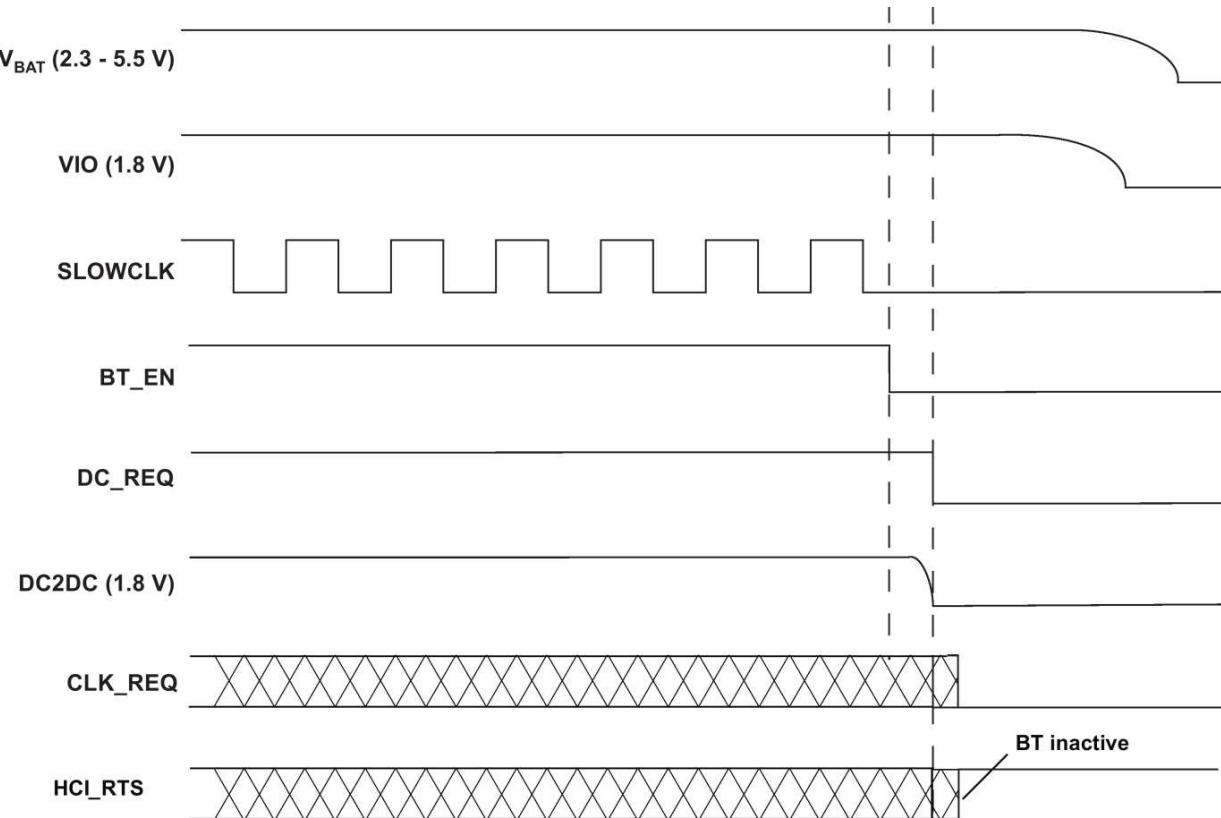

1. (A) After this sequence is completed, the device is in the low VIO-leakage state while in shutdown
2. The DC2DC(1.8V) signal can be monitored on BT\_FUNC2 Module Pin (#41)
3. DC\_REQ, CLK\_REQ, and F<sub>REF</sub> are internal signals shown for reference only

**Figure 5 Bluetooth Power-up Sequence**

Power up requirements:

1. No signals are allowed on the IO pins if no IO power supplied, because the IOs are not 'failsafe'. Exceptions are CLK\_REQ\_OUT, SLOWCLK, XTALP, and AUD\_xxx, which are failsafe and can tolerate external voltages with no VDDS and DC2DC.
2. VDDS and SLOWCLK must be stable before releasing BT\_EN.
3. Fast clock must be stable maximum 55 ms after BT\_EN goes HIGH.

## BLUETOOTH POWER-DOWN SEQUENCE

Notes:

1. The DC2DC(1.8V) signal can be monitored on BT\_FUNC2 Module Pin (#41)
2. DC\_REQ and CLK\_REQ are internal signals shown for reference only

**Figure 6 Bluetooth Power-down Sequence**

The TiWi-BLE module indicates completion of Bluetooth power up sequence by asserting HCI\_RTS low. This occurs up to 100 ms after BT\_EN goes high.

## ENABLE SCHEME

The module has 3 enable pins, one for each core: WL\_EN, and BT\_EN and FM\_EN. Presently, there are 2 modes of active operation now supported: WLAN and Bluetooth. It is recommended that the FM\_EN pin be grounded to disable the FM section. It is also recommended that the FM section be disabled by Bluetooth HCI commands.

1. Each core is operated independently by asserting each EN signal to Logic '1'. In this mode it is possible to control each core asynchronously and independently.
2. Bluetooth mode operation. WLAN will be operated through WL\_EN asynchronously and independently of Bluetooth.

## IRQ OPERATION

1. The default state of the WLAN\_IRQ prior to firmware initialization is 0.
2. During firmware initialization, the WLAN\_IRQ is configured by the SDIO module; a WLAN\_IRQ changes its state to 1.
3. A WLAN firmware interrupt is handled as follows:
  - a. The WLAN firmware creates an Interrupt-to-Host, indicated by a 1-to-0 transition on the WLAN\_IRQ line (host must be configured as active-low or falling-edge detect).
  - b. After the host is available, depending on the interrupt priority and other host tasks, it masks the firmware interrupt. The WLAN\_IRQ line returns to 1 (0-to-1 transition on the WLAN\_IRQ line).
  - c. The host reads the internal register status to determine the interrupt sources - the register is cleared after the read.
  - d. The host processes in sequence all the interrupts read from this register
  - e. The host unmasks the firmware interrupts.
4. The host is ready to receive another interrupt from the WLAN device.

## SLOW (32 KHZ) CLOCK SOURCE REQUIREMENTS

The slow clock is always supplied from an external source. It is input on the SLOW\_CLK pin, and can be a digital signal in the range of VIO only. For slow clock frequency and accuracy refer to Table 16. The external slow clock must be stable before the system exits from shut down mode.

Parameter <sup>[1]</sup>	Condition	Symbol	Min	Typ	Max	Unit
Input slow clock frequency				32768		Hz
Input slow clock accuracy	WLAN, BT				+/-250	ppm
Input transition time $T_r/T_f - 10\%$ to 90%		$T_r/T_f$			100	ns
Frequency input duty cycle			30	50	70	%
Input voltage limits	Square wave, DC coupled	VIH	0.65 x VIO		VIO	$V_{peak}$
		VIL	0		0.35 x VIO	
Input impedance			1			MΩ
Input capacitance					5	pF
Rise and fall time					100	ns
Phase noise	1 kHz				-125	dBc/Hz
