

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

**PROPER USE GUIDELINES**

Cumulative Trauma Disorders can result from the prolonged use of manually powered hand tools. Hand tools are intended for occasional use and low volume applications. A wide selection of powered application equipment for extended-use, production operations is available.

The PRO-CRIMPER III Hand Tool is a "Commercial" grade tool and is designed primarily for field installation, repair, maintenance work, or prototyping in industrial, commercial, or institutional applications. Product crimped with this tool will meet the crimp height requirement for hand tools in the appropriate 114 application specification, but may not comply with other feature parameters of the specification. Tyco Electronics offers a variety of tools to satisfy your performance requirements. For additional information, contact the Tooling Assistance Center at 1-800-722-1111.

Figure 1

**1. INTRODUCTION**

This instruction sheet provides application and maintenance procedures for Hand Tool Frame Assembly 58532-[ ], 58555-[ ], and 58588-[ ]. The tool is designed to accept interchangeable crimping die assemblies for crimping various types of connectors.

In most cases, the hand tool frame assembly is provided with a specific set of dies and is considered a component part of a crimping assembly. Refer to the appropriate instruction sheet packaged with the hand tool/crimping die assembly, or with the separate die assembly, for information regarding crimping procedures, crimp height inspection, and crimping die gaging.

Read these instructions thoroughly before installing dies and using the tool.

**NOTE**

*The hand tool frame assembly is designed to accept dies to crimp a variety of products. Contact your local Tyco Electronics Representative or the Tooling Assistance Center for information regarding the availability of dies for specific applications.*

Reasons for reissue are provided in Section 7, REVISION SUMMARY.

**2. DESCRIPTION (Figure 1)**

The hand tool consists of two crimping jaws, an adjustable ratchet, spring-actuated handles, two die retaining screws, and an emergency ratchet release. The slotted design of the crimping jaws permits easy installation and removal of crimping dies. The adjustable ratchet allows handle pressure to be set for optimum crimping die performance.

### 3. DIE INSTALLATION AND REMOVAL

Select the desired die assembly, remove the die retention screws from the tool jaws, and proceed as follows:

#### 3.1. Shouldered Dies (Figure 2)

1. Place the upper die in the stationary jaw of the tool frame.

Figure 2

2. Insert a die retention screw through the jaw and die and tighten the screw so that the die is held in place, but do not tighten the screw completely at this point.

**NOTE** Die assemblies with center contact crimp sections should be installed with the center contact crimp section toward the front of the tool jaws as shown in Figure 2. If indicated otherwise in other instructions, follow the specific die requirements demonstrated in that document.

3. Place the lower die in the moving jaw of the tool frame. Install a die retention screw through the jaw and die and tighten the screw so that the die is held in place, but do not tighten the screw completely at this point.

**NOTE** The hand tool ratchet has detents that are audible as five “clicks” as the handles are closed. The ratchet releases on the fifth “click.”

4. Slowly close the tool handles, allowing the dies to mate and/or align. Continue closing the tool handles until the ratchet makes the fourth “click,” then tighten both die retention screws until snug.

5. To remove the die assembly, close the tool handles until the ratchet releases, and allow the handles to open fully. Loosen and remove the die retention screws and slide the dies out of the tool jaws.

#### 3.2. Pinned Dies (Figure 3)

1. Install the wire and insulation anvil dies, with the chamfers facing the front of the tool, and with the die markings facing outward, into the movable jaw of the frame assembly.

2. Insert the die retaining pins and the short die retention screw. Do *not* tighten the screw completely.

3. Install the wire and insulation crimper dies, with the chamfers facing the front of the tool, and with the die markings facing outward, into the stationary jaw of the frame assembly.

4. Insert the die retaining pins and the long die retention screw. Do *not* tighten the screw completely.

Figure 3

5. Slowly close the tool handles, allowing the dies to mate and/or align. Continue closing the tool handles until the ratchet makes the fourth “click,” then tighten both die retention screws until snug.

6. Install the locator assembly and tighten the hex nut.

7. Reverse the procedure to remove the die assembly.

## 4. MAINTENANCE/INSPECTION

### 4.1. Daily Maintenance

Tyco Electronics recommends that operators of the tool be made aware of, and responsible for, the following steps of daily maintenance:

1. Remove dust, moisture, and any other contaminants from the tool with a clean, soft brush, or a clean, soft, lint-free cloth. Do NOT use hard or abrasive objects that could damage the tool.
2. Make certain that the pivot pins are in place and that they are secured with retaining rings.
3. All pins, pivot points, and bearing surfaces should be protected with a thin coat of any good SAE 20 motor oil. Do not oil excessively.
4. When the tool is not in use, keep handles closed to prevent objects from becoming lodged in the crimping jaws. Store the tool in a clean, dry area.

### 4.2. Periodic Inspection

Regular inspections of the tool should be performed by quality control personnel. A record of scheduled inspections should remain with the tool or be supplied to supervisory personnel responsible for the tool. Inspection frequency should be based upon amount of use, working conditions, operator training and skill, and established company standards.

1. Remove all lubrication and accumulated film by immersing the tool (handles partially closed) in a suitable commercial degreaser that will not affect paint or plastic material.
2. Make certain that all pivot pins are in place and secured with retaining rings.
3. Close tool handles until ratchet releases and then allow them to open freely. If they do not open quickly and fully, the spring is defective and must be replaced. See Section 6, PARTS REPLACEMENT.
4. Inspect the tool frame for wear or damage, paying particular attention to the tool jaws and pivot points. If damage is evident, refer to Section 6, PARTS REPLACEMENT. If tool is acceptable, lubricate and return to service.

#### NOTE

*This tool is recommended for R&D prototyping, networking applications, commercial/industrial maintenance, and field service repair. For other applications, please contact your Tyco Electronics Representative or the Tooling Assistance Center at the number at the bottom of page 1.*

### 5. CRIMP HEIGHT ADJUSTMENT

The tool frame assembly features a ratchet mechanism and adjustment wheel with eight settings.

The ratchet mechanism ensures that the tool has completed the cycle. The adjustment wheel controls the amount of handle pressure exerted on the tool jaws and crimping dies during the crimping procedure. Although the ratchet is preset prior to shipment, it is important that you verify the crimp height. Also, general use and subsequent wear may cause the tool to go out of adjustment. It is recommended that the crimp height be inspected — and adjusted, if necessary — on a regular basis by quality control personnel.

#### NOTE

*This is a general explanation of the procedure. For specific information, refer to the instruction sheet packaged with the die assembly.*

1. Crimp a contact onto a properly-prepared wire of the correct size.
2. If the crimp height is greater than recommended, remove the ratchet wheel adjustment screw and rotate the adjustment wheel COUNTERCLOCKWISE to a higher setting. Repeat as required.
3. If the crimp height is less than recommended, remove the ratchet wheel adjustment screw and rotate the adjustment wheel CLOCKWISE to a lower setting. Repeat as required.
4. If the crimp cannot be made to conform to the dimensions provided in the appropriate product application specification, the tool and/or dies are defective and must be replaced.

## 6. PARTS REPLACEMENT

Hand Tool Frame Assemblies 58532-[ ], 58555-[ ], and 58588-[ ] are inspected prior to shipment. It is recommended that they be inspected upon arrival to ensure that they have not become damaged during shipping.

Refer to the parts list in Figure 4 to determine the proper location and orientation of the part in the tool frame.

Additional tools and parts may be ordered from:
