

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

HSSR-7110, HSSR-7111, HSSR-7112, HSSR-711E, 5962-9314001, 5962-9314002¹

90V/1.0Ω, Hermetically Sealed, Power MOSFET
Optocoupler

Data Sheet

Description

The HSSR-7110, HSSR-7111, HSSR-7112, HSSR-711E and SMD 5962-9314001, 5962-9314002 are single-channel power MOSFET optocouplers, constructed in eight-pin, hermetic, dual-in-line, ceramic packages. The devices operate exactly like a solid-state relay.

The products are capable of operation and storage over the full military temperature range and can be purchased as a commercial product (HSSR-7110), with full MIL-PRF-38534 Class H testing (HSSR-7111 and HSSR-7112), with MIL-PRF-38534 Class E testing (Class K with exceptions) (HSSR-711E) or from the DLA Standard Microcircuit Drawing (SMD) 5962-93140. Details of the Class E program exceptions are listed here:

1. Nondestructive Bond Pull, Test method 2023 of MIL-STD-883 in device screening is not required.
2. Particle Impact Noise Detection (PIND), Test method 2020 of MIL-STD-883 in device screening and group C testing is not required.
3. Die Shear Strength, Test method 2019 of MIL-STD-883 in group B testing is not required.
4. Internal Water Vapor Content, Test method 1018 of MIL-STD-883 in group C testing is not required.
5. Scanning Electron Microscope (SEM) inspections, Test method 2018 of MIL-STD-883 in element evaluation is not required.

1. See [Selection Guide – Lead Configuration Options](#) for available extensions.

Features

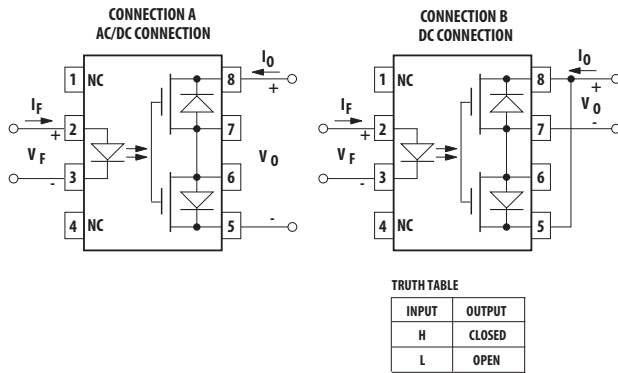

- Dual marked with device part number and DLA Standard Microcircuit Drawing (SMD)
- ac/dc signal and power switching
- Compact solid-state bidirectional switch
- Manufactured and tested on a MIL-PRF-38534 certified line
- QML-38534, Class H and Class E
- Hermetically sealed 8-pin, dual-in-line package
- Small size and weight
- Performance guaranteed over -55°C to $+125^{\circ}\text{C}$
- Connection A 0.8A, 1.0Ω
- Connection B 1.6A, 0.25Ω
- 1500 Vdc withstand test voltage
- High transient immunity
- 5 Amp output surge current

Applications

- Military and space
- High reliability systems
- Standard 28 Vdc and 48 Vdc load driver
- Standard 24 Vac load driver
- Aircraft controls
- ac/dc electromechanical and solid-state relay replacement
- I/O modules
- Harsh industrial environments

CAUTION It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation that may be induced by ESD.

Functional Diagrams

All devices are manufactured and tested on a MIL-PRF-38534 certified line, and Class H and Class E devices are included in the DLA Qualified Manufacturers List, QML-38534 for Hybrid Microcircuits. Each device contains an AlGaAs light-emitting diode optically coupled to a photovoltaic diode stack, which drives two discrete power MOSFETs. The device operates as a solid-state replacement for single-pole, normally open (1 Form A) relay used for general-purpose switching of signals and loads in high reliability applications.

The devices feature logic level input control and very low output on-resistance, making them suitable for both ac and dc loads. Connection A, as shown in the [Functional Diagrams](#), allows the device to switch either ac or dc loads. Connection B, with the polarity and pin configuration as shown, allows the device to switch dc loads only. The advantage of Connection B is that the on-resistance is significantly reduced, and the output current capability increases by a factor of two.

The devices are convenient replacements for mechanical and solid-state relays where high component reliability with standard footprint lead configuration is desirable. Devices may be purchased with a variety of lead bend and plating options. See [Selection Guide – Lead Configuration Options](#) table for details. Standard microcircuit drawing (SMD) parts are available for each package and lead style.

The HSSR-7110, HSSR-7111, HSSR-7112, HSSR-711E, and SMD 5962-9314001, 5962-9314002 are designed to switch loads on 28 Vdc power systems. They meet 80V surge and ±600V spike requirements.

CAUTION Maximum Switching Frequency – Care should be taken during repetitive switching of loads so as not to exceed the maximum output current, maximum output power dissipation, maximum case temperature, and maximum junction temperature.

- Commercial parts receive 100% testing at 25°C (Subgroups 1 and 9). SMD, Class H, and Class E parts receive 100% testing at 25°C , 125°C , and -55°C (subgroups 1 and 9, 2 and 10, 3 and 11, respectively).
- During the pulsed R_{ON} measurement (I_O duration $< 30\ \text{ms}$), ambient (T_A) and case temperature (T_C) are equal.
- Applies to HSSR-7110, HSSR-7111, HSSR-711E, 5962-9314001Hxx and 5962-9314001Exx devices only.
- Applies to HSSR-7112 and 5962-9314002Hxx devices only.
- Device considered a two-terminal device: pins 1 through 4 shorted together and pins 5 through 8 shorted together.
- This is a momentary withstand test, not an operating condition.

Typical Characteristics

All typical values are at $T_A = 25^\circ\text{C}$, $I_F(\text{ON}) = 10\text{ mA}$, $V_F(\text{OFF}) = 0.6\text{V}$ unless otherwise specified.

| Parameter | Symbol | Test Conditions | Typ | Unit | Figure |
|--|---------------------------|---|-----------|----------------------------|--------|
| Output Off-Capacitance | $C_{O(\text{OFF})}$ | $V_O = 28\text{V}$, $f = 1\text{ MHz}$ | 145 | pF | 16 |
| Output Offset Voltage ^a | $ V_{OS} $ | $I_F = 10\text{ mA}$, $I_O = 0\text{ mA}$ | 2 | μV | 19 |
| Input Diode Temperature Coefficient | $\Delta V_F / \Delta T_A$ | $I_F = 10\text{ mA}$ | -1.4 | $\text{mV}/^\circ\text{C}$ | |
| Input Capacitance ^b | C_{IN} | $V_F = 0\text{V}$, $f = 1\text{ MHz}$ | 20 | pF | |
| Input-Output Capacitance ^c | C_{I-O} | $V_{I-O} = 0\text{V}$, $f = 1\text{ MHz}$ | 1.5 | pF | |
| Input-Output Resistance ^c | R_{I-O} | $V_{I-O} = 500\text{V}$, $t = 60\text{s}$ | 10^{13} | Ω | |
| Turn On Time With Peaking ^d | t_{ON} | $I_{\text{FPK}} = 100\text{ mA}$, $I_{\text{FSS}} = 10\text{ mA}$, $V_{DD} = 28\text{V}$, $I_O = 800\text{ mA}$ | 0.22 | ms | 1 |

- V_{OS} is a function of I_F , and is defined between pins 5 and 8, with pin 5 as the reference. V_{OS} must be measured in a stable ambient (free of temperature gradients).
- Zero-bias capacitance measured between the LED anode and cathode.
- Device considered a two-terminal device: pins 1 through 4 shorted together and pins 5 through 8 shorted together.
- For a faster turn-on time, the optional peaking circuit shown in Figure 1 can be implemented.

NOTE:
IN ORDER TO DETERMINE V_{OUT} CORRECTLY, THE CASE TO AMBIENT THERMAL IMPEDANCE MUST BE MEASURED FOR THE BURN-IN BOARDS TO BE USED. THEN, KNOWING θ_{CA} , DETERMINE THE CORRECT OUTPUT CURRENT PER FIGURES 2 AND 4 TO INSURE THAT THE DEVICE MEETS THE DERATING REQUIREMENTS AS SHOWN.

Applications Information

Thermal Model

The steady-state thermal model for the HSSR-711x is shown in Figure 21. The thermal resistance values given in this model can be used to calculate the temperatures at each node for a given operating condition. The thermal resistances between the LED and other internal nodes are very large in comparison with the other terms and are omitted for simplicity. The components do, however, interact indirectly through θ_{CA} , the case-to-ambient thermal resistance. All heat generated flows through θ_{CA} , which raises the case temperature T_C accordingly. The value of θ_{CA} depends on the conditions of the board design and is, therefore, determined by the designer.

The maximum value for each output MOSFET junction-to-case thermal resistance is specified as 15°C/W. The thermal resistance from FET driver junction-to-case is also 15°C/W/W. The power dissipation in the FET driver, however, is negligible in comparison to the MOSFETs.

Figure 21 Thermal Model

- T_{je} = LED JUNCTION TEMPERATURE
- T_{jf1} = FET 1 JUNCTION TEMPERATURE
- T_{jf2} = FET 2 JUNCTION TEMPERATURE
- T_{jd} = FET DRIVER JUNCTION TEMPERATURE
- T_C = CASE TEMPERATURE (MEASURED AT CENTER OF PACKAGE BOTTOM)
- T_A = AMBIENT TEMPERATURE (MEASURED 6" AWAY FROM THE PACKAGE)
- θ_{CA} = CASE-TO-AMBIENT THERMAL RESISTANCE

ALL THERMAL RESISTANCE VALUES ARE IN °C/W

On-Resistance and Rating Curves

The output on-resistance, R_{ON} , specified in this data sheet, is the resistance measured across the output contact when a pulsed current signal ($I_O = 800$ mA) is applied to the output pins. The use of a pulsed signal (≤ 30 ms) implies that each junction temperature is equal to the ambient and case temperatures. The steady-state resistance, R_{SS} , on the other hand, is the value of the resistance measured across the output contact when a DC current signal is applied to the output pins for a duration sufficient to reach thermal equilibrium. R_{SS} includes the effects of the temperature rise of each element in the thermal model. Rating curves are shown in Figure 2 and Figure 4. Figure 2 specifies the maximum average output current allowable for a given ambient temperature. Figure 4 specifies the output power dissipation allowable for a given ambient temperature. Above 55°C (for $\theta_{CA} = 80^\circ\text{C/W}$) and 107°C (for $\theta_{CA} = 40^\circ\text{C/W/W}$), the maximum allowable output current and power dissipation are related by the expression $R_{SS} = P_{O(max)} / (I_{O(max)})^2$ from which R_{SS} can be calculated. Staying within the safe area assures that the steady-state junction temperatures remain less than 150°C. As an example, for $T_A = 95^\circ\text{C}$ and $\theta_{CA} = 80^\circ\text{C/W}$, Figure 2 shows that the output current should be limited to less than 610 mA. A check with Figure 4 shows that the output power dissipation at $T_A = 95^\circ\text{C}$ and $I_O = 610$ mA, is limited to less than 0.35W. This yields an R_{SS} of 0.94Ω.

Design Considerations for Replacement of Electromechanical Relays

The HSSR-711x family can replace electromechanical relays with comparable output voltage and current ratings. The following design issues need to be considered in the replacement circuit.

Input Circuit

The drive circuit of the electromechanical relay coil needs to be modified so that the average forward current driving the LED of the HSSR-711x does not exceed 20 mA. A nominal forward drive current of 10 mA is recommended. A recommended drive circuit with 5V VCC and CMOS logic gates is shown in [Figure 1](#). If higher VCC voltages are used, adjust the current limiting resistor to a nominal LED forward current of 10 mA. One important consideration to note is that when the LED is turned off, no more than 0.6V forward bias should be applied across the LED. Even a few microamps of current may be sufficient to turn on the HSSR-711x, although it may take a considerable time. The drive circuit should maintain at least 5 mA of LED current during the ON condition. If the LED forward current is less than the 5 mA level, it causes the HSSR-711x to turn on with a longer delay. In addition, the power dissipation in the output power MOSFETs increases, which, in turn, may violate the power dissipation guidelines and affect the reliability of the device.

Output Circuit

Unlike with electromechanical relays, when considering solid-state relays, the designer should pay careful attention to the output on-resistance. The previous section, [On-Resistance and Rating Curves](#), describes the issues that need to be considered. In addition, for strictly dc applications, the designer has an advantage using Connection B, which has twice the output current rating as Connection A. Furthermore, for dc-only applications, with Connection B the on-resistance is considerably less when compared to Connection A.

Output over-voltage protection is yet another important design consideration when replacing electromechanical relays with the HSSR-711x. The output power MOSFETs can be protected using Metal oxide varistors (MOVs) or TransZorbs against voltage surges that exceed the 90V output withstand voltage rating. Examples of sources of voltage surges are inductive load kickbacks, lightning strikes, and electrostatic voltages that exceed the specifications on this data sheet. For more information on output load and protection, refer to Application Note 1047.
