## 74AUP1G74

## Low-power D-type flip-flop with set and reset; positive-edge trigger

Rev. 10 - 28 October 2016
Product data sheet

## 1. General description

The 74AUP1G74 provides a low-power, low-voltage single positive-edge triggered D-type flip-flop with individual data (D), clock (CP), set ( $\overline{\mathrm{SD}}$ ) and reset ( $\overline{\mathrm{R} D}$ ) inputs and complementary Q and $\overline{\mathrm{Q}}$ outputs. The $\overline{\mathrm{S}} \mathrm{D}$ and $\overline{\mathrm{R}} \mathrm{D}$ are asynchronous active LOW inputs and operate independently of the clock input. Information on the data input is transferred to the Q output on the LOW-to-HIGH transition of the clock pulse. The D input must be stable one set-up time prior to the LOW-to-HIGH clock transition for predictable operation.

Schmitt trigger action at all inputs makes the circuit tolerant to slower input rise and fall times across the entire $\mathrm{V}_{\mathrm{CC}}$ range from 0.8 V to 3.6 V .

This device ensures a very low static and dynamic power consumption across the entire $\mathrm{V}_{\mathrm{CC}}$ range from 0.8 V to 3.6 V .

This device is fully specified for partial power-down applications using loff. The loff circuitry disables the output, preventing the damaging backflow current through the device when it is powered down.

[1] All typical values are measured at nominal $\mathrm{V}_{\mathrm{CC}}$.
[2] $t_{p d}$ is the same as $t_{\text {PLH }}$ and $t_{\text {PHL }}$.
[3] $C_{P D}$ is used to determine the dynamic power dissipation ( $P_{D}$ in $\left.\mu W\right)$.
$P_{D}=C_{P D} \times V_{C C}{ }^{2} \times f_{i} \times N+\Sigma\left(C_{L} \times V_{C C}{ }^{2} \times f_{0}\right)$ where:
$f_{i}=$ input frequency in MHz ;
$\mathrm{f}_{\mathrm{o}}=$ output frequency in MHz ;
$\mathrm{C}_{\mathrm{L}}=$ output load capacitance in pF ;
$\mathrm{V}_{\mathrm{CC}}=$ supply voltage in V ;
$N=$ number of inputs switching;
$\Sigma\left(C_{L} \times V_{C C}{ }^{2} \times f_{0}\right)=$ sum of outputs.

Measurement points are given in Table 10.
The shaded areas indicate when the input is permitted to change for predictable output performance.
$\mathrm{V}_{\mathrm{OL}}$ and $\mathrm{V}_{\mathrm{OH}}$ are typical output voltage levels that occur with the output load.

Definitions for test circuit:
$R_{L}=$ Load resistance.
$C_{L}=$ Load capacitance including jig and probe capacitance.
$\mathrm{R}_{\mathrm{T}}=$ Termination resistance should be equal to the output impedance $\mathrm{Z}_{0}$ of the pulse generator
$\mathrm{V}_{\mathrm{EXT}}=$ External voltage for measuring switching times.
