APPLICATIONS:

- **3.3V High Speed Bus Switching and Bus Isolation**
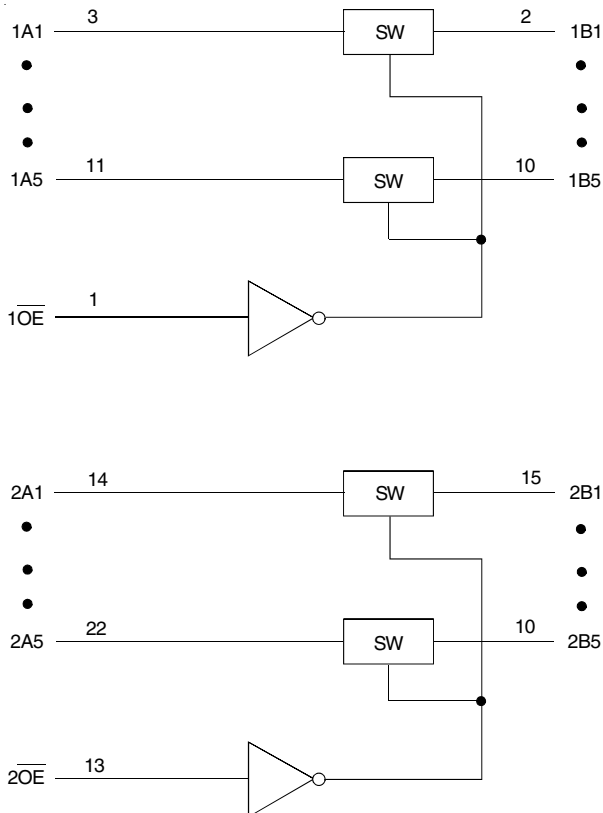

DESCRIPTION:

The CBTLV3384 is a ten bit high-speed bus switch with low on-state resistance of the switch allowing connections to be made with minimal propagation delay.
The device is organized as dual 5-bit bus switches with separate output-enable ($\overline{OE}$) inputs, to allow use as two 5-bit bus switches or one 10-bit bus switch. When $\overline{OE}$ is low, the associated 5-bit bus switch is on and A port is connected to B port. When $\overline{OE}$ is high, the switch is open, and a high-impedance state exists between the two ports.

To ensure the high-impedance state during power up or power down, $\overline{OE}$ should be tied to Vcc through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

			$I_O = 24mA$	—	5	7	
		$V_I = 2.4V$	$I_O = 15mA$	—	10	15	

NOTES:
1. The increase in supply current is attributable to each current that is at the specified voltage level rather than V_{CC} or GND.
2. This is measured by the voltage drop between the A and B terminals at the indicated current through the switch. On-state resistance is determined by the lower of the voltages of the two (A or B) terminals.
