Chipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

74HC7403-Q100;
74HCT7403-Q100

4-bit x 64-word FIFO register; 3-state

Rev. 1 — 21 September 2012   **Product data sheet**

1. General description

The 74HC7403-Q100; 74HCT7403-Q100 is an expandable, First-In First-Out (FIFO) memory organized as 64 words by 4 bits. A guaranteed 15 MHz data-rate makes it ideal for high-speed applications. A higher data-rate can be obtained in applications where the status flags are not used (burst-mode). With separate controls for shift-in (SI) and shift-out ($\overline{\text{SO}}$), reading and writing operations are completely independent, allowing synchronous and asynchronous data transfers. Additional controls include a master-reset input ($\overline{\text{MR}}$), an output enable input ($\overline{\text{OE}}$) and flags. The data-in-ready (DIR) and data-out-ready (DOR) flags indicate the status of the device. Inputs include clamp diodes that enable the use of current limiting resistors to interface inputs to voltages in excess of V_{CC}.

This product has been qualified to the Automotive Electronics Council (AEC) standard Q100 (Grade 1) and is suitable for use in automotive applications.

2. Features and benefits

- Automotive product qualification in accordance with AEC-Q100 (Grade 1)
    - Specified from −40 °C to +85 °C and from −40 °C to +125 °C
- Synchronous or asynchronous operation
- 30 MHz (typical) shift-in and shift-out rates
- Readily expandable in word and bit dimensions
- Pinning arranged for easy board layout: input pins directly opposite output pins
- Input levels:
    - For 74HC7403-Q100: CMOS level
    - For 74HCT7403-Q100: TTL level
- 3-state outputs
- Complies with JEDEC standard JESD7A
- ESD protection:
    - MIL-STD-883, method 3015 exceeds 2000 V
    - HBM JESD22-A114F exceeds 2000 V
    - MM JESD22-A115-A exceeds 200 V (C = 200 pF, R = 0 Ω)
- Multiple package options

3. Applications

- High-speed disc or tape controller
- Communications buffer

4. Ordering information

Table 1.   Ordering information

Type number	Package			
	Temperature range	**Name**	**Description**	**Version**
74HC7403D-Q100	−40 °C to +125 °C	SO16	plastic small outline package; 16 leads; body width 3.9 mm	SOT109-1
74HCT7403D-Q100

Fig 5.   Pin configuration

6.2 Pin description

Table 2.   Pin description

Symbol	Pin	Description
$\overline{OE}$	1	output enable input (active LOW)
DIR	2	data-in-ready output
SI	3	shift-in input (active HIGH)
D0 to D3	4, 5, 6, 7	parallel data input
GND	8	ground (0 V)
$\overline{MR}$	9	asynchronous master-reset input (active LOW)
Q0 to Q3	13, 12, 11, 10	data output
DOR	14	data-out-ready output
$\overline{SO}$	15	shift-out input (active LOW)
V_{CC}	16	supply voltage

7. Functional description

A DIR flag indicates the input stage status, either empty and ready to receive data (DIR = HIGH) or full and busy (DIR = LOW). When DIR and SI are HIGH, data present at D0 to D3 is shifted into the input stage; once complete DIR goes LOW. When SI is set LOW, data is automatically shifted to the output stage or to the last empty location. DIR set HIGH indicates a FIFO which can receive data.

A DOR flag indicates the output stage status, either data available (DOR = HIGH) or busy (DOR = LOW). When $\overline{SO}$ and DOR are HIGH, data is available at the outputs (Q0 to Q3). When $\overline{SO}$ is set LOW new data may be shifted into the output stage, once complete DOR is set HIGH.

7.1 Expanded format

The DOR and DIR signals are used to allow the 74HC7403-Q100; 74HCT7403-Q100 to be cascaded. Both parallel and serial expansion is possible. (see Figure 18).

Serial expansion is only possible with typical devices.

7.1.1 Parallel expension

Parallel expension is accomplished by logically ANDing the DOR and DIR signals to form a composite signal.

7.1.2 Serial expension

Parallel expension is accomplished by:

- Tying the data outputs of the first device to the data inputs of the second device.
- Connecting the DOR pin of the first device to the SI pin of the second device.
- Connecting the $\overline{SO}$ pin of the first device to the DIR pin of the second device.

8. Limiting values

Table 3.   Limiting values
In accordance with the Absolute Maximum Rating System (IEC 60134). Voltages are referenced to GND (ground = 0 V).

Symbol	Parameter	Conditions	Min	Max	Unit
V_{CC}	supply voltage		−0.5	+7	V
I_{IK}	input clamping current	$V_I < -0.5$ V or $V_I > V_{CC} + 0.5$ V	-	±20	mA
I_{OK}	output clamping current	$V_O < -0.5$ V or $V_O > V_{CC} + 0.5$ V	-	±20	mA
I_O	output current	$V_O = -0.5$ V to ($V_{CC} + 0.5$ V)	-	±35	mA
I_{CC}	supply current		-	+70	mA
I_{GND}	ground current		-	−70	mA
T_{stg}	storage temperature		−65	+150	°C
P_{tot}	total power dissipation	[1]	-	500	mW

[1]   For SO16 packages: above 70 °C the value of P_{tot} derates linearly with 8 mW/K.

9. Recommended operating conditions

Table 4. Recommended operating conditions
Voltages are referenced to GND (ground = 0 V)

Symbol	Parameter	Conditions	74HC7403-Q100			74HCT7403-Q100			Unit
			Min	Typ	Max	Min	Typ	Max	
V_{CC}	supply voltage		2.0	5.0	6.0	4.5	5.0	5.5	V
V_I	input voltage		0	-	V_{CC}	0	-	V_{CC}	V
V_O	output voltage		0	-	V_{CC}	0	-	V_{CC}	V
T_{amb}	ambient temperature		−40	+25	+125	−40	+25	+125	°C
$\Delta t/\Delta V$	input transition rise and fall rate	V_{CC} = 2.0 V	-	-	625	-	-	-	ns/V
		V_{CC} = 4.5 V	-	1.67	139	-	1.67	139	ns/V
		V_{CC} = 6.0 V	-	-	83	-	-	-	ns/V

10. Static characteristics

Table 5. Static characteristics
At recommended operating conditions; voltages are referenced to GND (ground = 0 V).

Symbol	Parameter	Conditions	25 °C			−40 °C to +85 °C		−40 °C to +125 °C		Unit

C_{PD}	power dissipation capacitance	V_I = GND to V_{CC} − 1.5 V [7]	-	490	-	-	-	-	-	pF

[1] t_{pd} is the same as t_{PLH} and t_{PHL}.

[2] t_{en} is the same as t_{PZH} and t_{PZL}.

[3] t_{dis} is the same as t_{PLZ} and t_{PHZ}.

[4] t_t is the same as t_{THL} and t_{TLH}.

[5]   This is the ripple through delay.

[6]   This is the bubble-up delay.

[7] C_{PD} is used to determine the dynamic power dissipation (P_D in μW).

$P_D = C_{PD} \times V_{CC}^2 \times f_i \times N + \Sigma(C_L \times V_{CC}^2 \times f_o)$ where:

f_i = input frequency in MHz;

f_o = output frequency in MHz;

C_L = output load capacitance in pF;

V_{CC} = supply voltage in V;

N = number of inputs switching;

$\Sigma(C_L \times V_{CC}^2 \times f_o)$ = sum of outputs.

12. Waveforms

Measurement points are given in Table 7.

V_{OL} and V_{OH} are typical voltage output levels that occur with the output load.

Shifting in sequence FIFO empty to FIFO full

(1) DIR initially HIGH; FIFO is prepared for valid data

(2) SI set HIGH; data loaded into input stage

(3) DIR goes LOW; input stage "busy"

(4) SI set LOW; data from first location "ripple through"

(5) DIR goes HIGH; status flag indicates FIFO prepared for additional data

(6) Repeat process to load 2nd word through to 64th word into FIFO; DIR remains LOW; with attempt to shift into full FIFO, no data transfer occurs.

Fig 6. Propagation delay SI input to DIR output, the SI pulse width and the SI maximum frequency
74HC_HCT7403_Q100

**Product data sheet**

Rev. 1 — 21 September 2012

13 of 32

Measurement points are given in Table 7.

V_{OL} and V_{OH} are typical voltage output levels that occur with the output load.

With FIFO full; SI held HIGH in anticipation of empty location

(1) FIFO is initially full, shift-in is held HIGH

(2) $\overline{SO}$ pulse; data in output stage is unloaded, "bubble-up" process of empty location begins

(3) DIR HIGH; when empty location reaches input stage, flag indicates that FIFO is prepared for data input

(4) DIR returns to LOW; data returns to LOW; data shift-in to empty location is complete, FIFO is full again

(5) SI set LOW; necessary to complete shift-in process, DIR remains LOW, because FIFO is full

Fig 7. Bubble-up delay $\overline{SO}$ input to DIR output and the DIR pulse width.

Measurement points are given in Table 7.

V_{OL} and V_{OH} are typical voltage output levels that occur with the output load.

Master reset applied with FIFO full

(1) DIR LOW; output ready HIGH; assume that FIFO is full

(2) $\overline{MR}$ pulse LOW; clears FIFO

(3) DIR goes HIGH; flag indicates input prepared for valid data

(4) DOR goes LOW; flag indicates FIFO empty

(5) Qn outputs go LOW (only last bit is reset)

**Fig 8.　Propagation delay $\overline{MR}$ input to DIR output, DOR output and Qn outputs and the $\overline{MR}$ pulse width.**

Measurement points are given in Table 7.

V_{OL} and V_{OH} are typical voltage output levels that occur with the output load.

(1) DOR HIGH; no data transfer in progress, valid data is present at the output stage

(2) $\overline{SO}$ set HIGH; result in DOR going LOW

(3) DOR goes LOW; output stage "busy"

(4) $\overline{SO}$ set LOW; data in the input stage is unloaded, and new data replaces it as empty location "bubbles-up" to input stage

(5) DOR goes HIGH; transfer process completed, valid data present at output after the specified propagation delay

(6) Repeat process to unload the 3rd through the 64th word from FIFO

(7) DOR remains LOW; FIFO is empty

Fig 9. Propagation delay $\overline{SO}$ input to DOR output, the $\overline{SO}$ pulse width and the $\overline{SO}$ maximum frequency.

Measurement points are given in Table 7.

V_{OL} and V_{OH} are typical voltage output levels that occur with the output load.

With FIFO empty; $\overline{SO}$ is held HIGH in anticipation

(1) FIFO is initially empty. $\overline{SO}$ is held HIGH.

(2) SI pulse; loads data into FIFO and initiates ripple through process

(3) DOR flag signals the arrival of valid data at the output stage

(4) Output transition; data arrives at output stage after the specified propagation delay between the rising and falling edge of the DOR pulse to the Qn output

(5) DOR goes LOW; data shift-out is completed, FIFO is empty again

(6) $\overline{SO}$ set LOW; necessary to complete shift-out process. DOR remains LOW, because FIFO is empty

Fig 10. Ripple through delay SI input to DOR output, propagation delay DOR input to Qn outputs and the DOR pulse width

Measurement points are given in Table 7.

V_{OL} and V_{OH} are typical voltage output levels that occur with the output load.

Shift-in operation; high speed burst mode

In the high-speed mode, the burst-in rate is determined by the minimum shift-in HIGH and shift-in LOW specifications. The DIR status flag is a "don't care" condition, and a shift-in pulse can be applied regardless of the flag. An SI pulse which would overflow the storage capacity of the FIFO is ignored.

**Fig 11. Shift-in (SI) pulse width and maximum frequency (SI)**

13. Application information
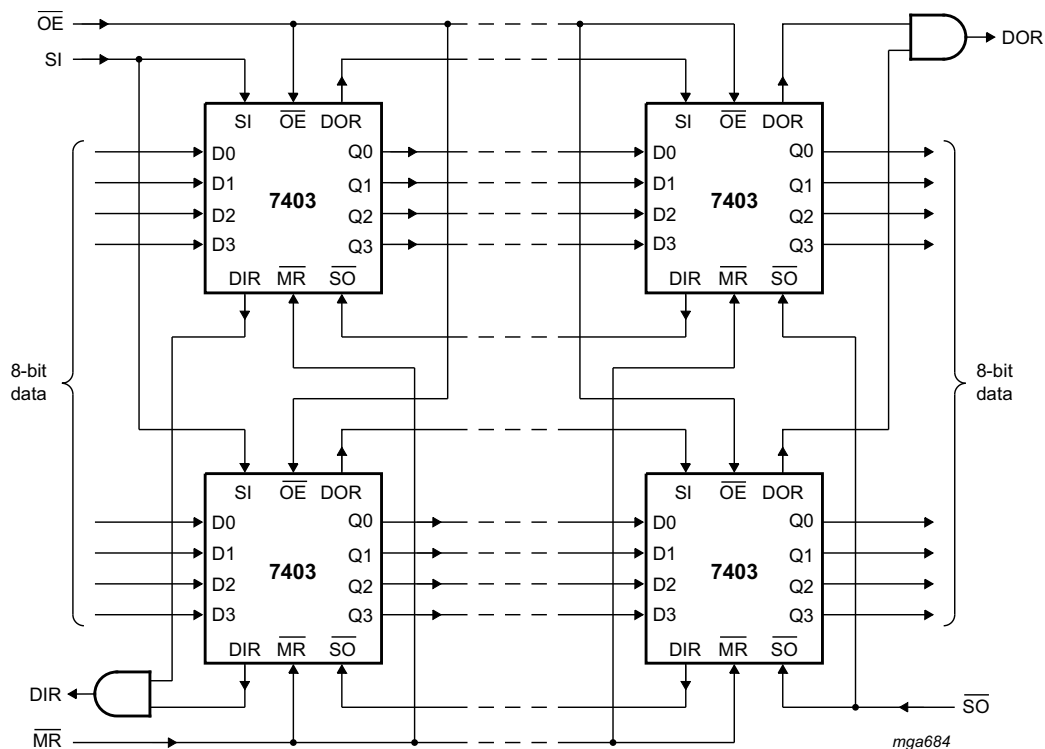

Fig 18. Expanded FIFO (parallel and serial) for increased word length; 8 bits wide x 64 n-bits
The 74HC7403-Q100; 74HCT7403-Q100 is easily expanded to increase word length. Composite DIR and DIR flags are formed with the addition of an AND gate. The basic operation and timing are identical to a single FIFO, with the exception of an added gate delay on the flags.

Fig 19. Expanded FIFO for increased word length; 64 words x 10 bits
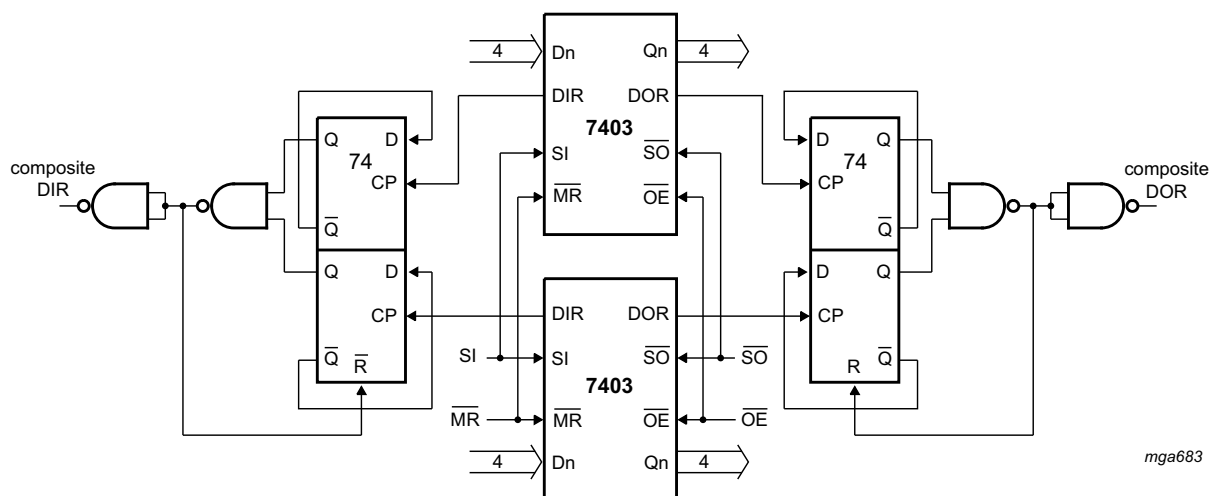

This circuit is only required if the SI input is constantly held HIGH, when the FIFO is empty and the automatic shift-in cycles are started or if the $\overline{SO}$ output is constantly held HIGH, when the FIFO is full and the automatic shift-out cycles are started (see Figure 7 and Figure 10).

Fig 20. Expanded FIFO for increased word length

13.1 Expanded format

Figure 21 shows two cascaded FIFOs providing a capacity of 128 words x 4 bits. Figure 22 shows the signals on the nodes of both FIFOs after the application of the SI pulse, when both FIFOs are initially empty. After a ripple through delay, data arrives at the output of FIFOA. Due to $\overline{\text{SOA}}$ being HIGH, a DORA pulse is generated. The requirements od SIB and DnB are satisfied by the DORA pulse width and the timing between the rising edge of DORA and QnA. After a second ripple through delay data arrives at the output of FIFOB.

Figure 23 shows the signals on the nodes of both FIFOs after the application of the $\overline{\text{SOB}}$ pulse, when both FIFOs are initially full. After a bubble-up delay, a DIRB pulse is generated, which acts as a $\overline{\text{SOA}}$ pulse for FIFOA. One word is transferred from the output of FIFOA to the input of FIFOB. The requirements of the $\overline{\text{SOA}}$ pulse for FIFOA is satisfied by the pulse width of DORB. After a second bubble-up delay an empty space arrives at DnA, at which time DIRA goes HIGH. Figure 24 shows the waveforms at all external nodes of both FIFOs during a complete shift-in and shift-out sequence.

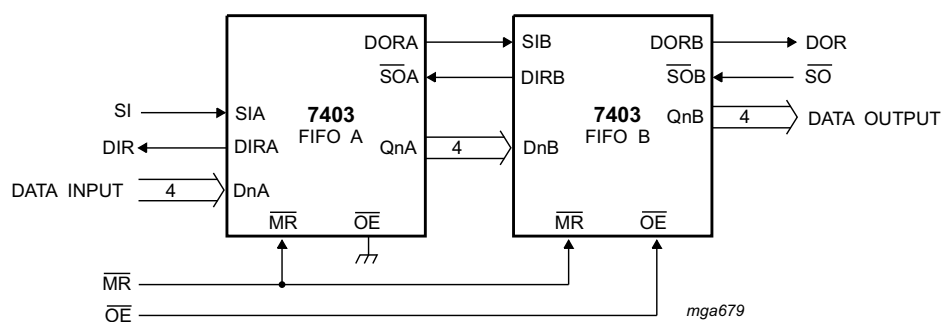

The 74HC7403-Q100; 74HCT7403-Q100 is easily cascaded to increase word capacity without external circuitry. In cascaded format, all necessary communications are handled by the FIFOs. Figure 22 and Figure 23 demonstrate the communication timing between FIFOA and FIFOB. Figure 24 provides an overview of pulses and timing of two cascaded FIFOs, when shifted full and shifted empty again.

Fig 21. Cascading for increased word capacity; 128 words x 4 bits

mga666
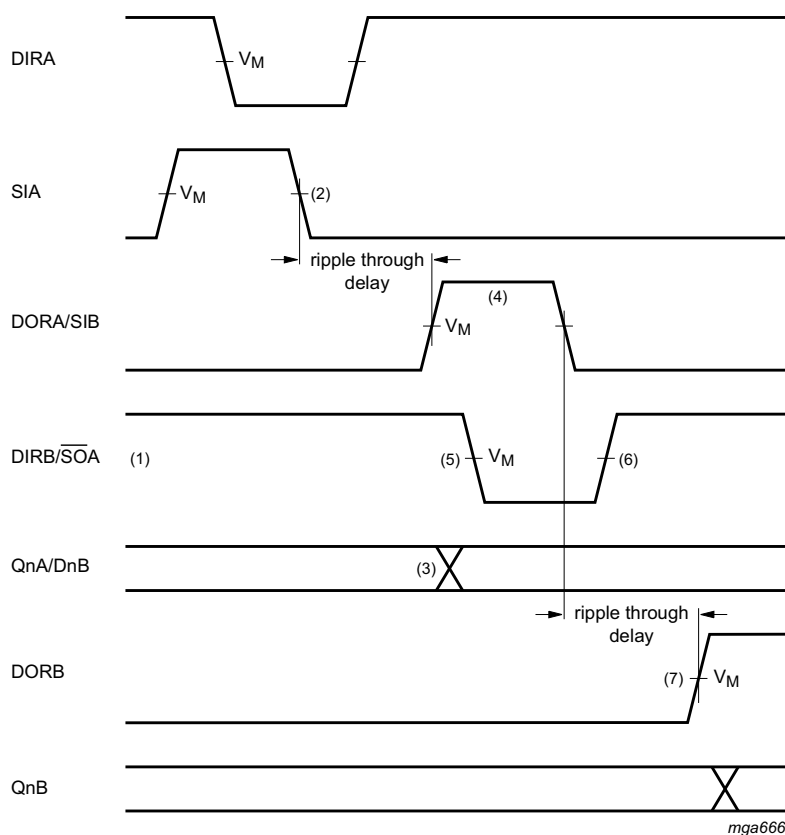

(1) FIFOA and FIFOB are initially empty, $\overline{SOA}$ held HIGH in anticipation of data

(2) Load one word into FIFOA; SI pulse; applied. results in DIR pulse

(3) Data-out A/ data-in B transition; valid data arrives at FIFOA output stage after a specified delay of the DOR flag, meeting data input set-up requirements of FIFOB.

(4) DORA and SIB pulse HIGH; (ripple through delay after SIA LOW) data is unloaded from FIFOA as a result of the data output ready pulse, data is shifted into FIFOB

(5) DIRB and $\overline{SOA}$ go LOW; flag indicates that input stage of FIFOB is busy, shift-out of FIFOA is complete

(6) DIRB and $\overline{SOA}$ go HIGH automatically; the input stage of FIFOB is again able to receive data, $\overline{SO}$ is held HIGH in anticipation of additional data

(7) DORB goes HIGH; (ripple through delay after SIB LOW) valid data is present one propagation delay later at the FIFOB output stage

Fig 22. FIFO to FIFO communication; input timing under empty condition

mga667
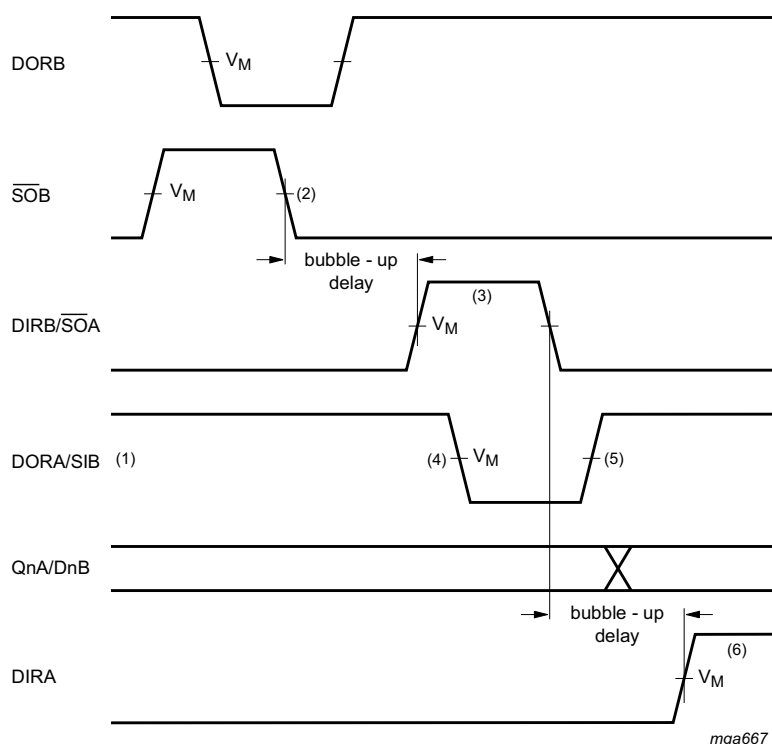

(1) FIFOA and FIFOB initially full, SIB held HIGH in anticipation of shifting in new data as an empty location bubbles-up

(2) Unload one word from FIFOB; $\overline{SO}$ pulse applied, results in DOR pulse

(3) DIRB and $\overline{SOA}$ pulse HIGH; (bubble-up delay after $\overline{SOB}$ LOW) data is loaded into FIFOB as a result of the DIR pulse, data is shifted out of FIFOA

(4) DORA and SIB go LOW; flag indicates that the output stage of FIFOA is busy, shift-in of FIFOB is complete

(5) DORA and SIB go HIGH; flag indicates that valid data is again available at FIFOA output stage, SIB is held HIGH, awaiting bubble-up of empty location.

(6) DIRA goes HIGH; (bubble-up delay after $\overline{SOA}$ LOW) an empty location is present at input stage of FIFOA

Fig 23. FIFO to FIFO communication; output timing under full condition
