Ultra-configurable multiple function gate; 3-state

Rev. 9 — 12 December 2016

Product data sheet

## 1. General description

The 74LVC1G99 provides a low voltage, ultra-configurable, multiple function gate with 3-state output. The device can be configured as one of several logic functions including, AND, OR, NAND, NOR, XOR, XNOR, inverter, buffer and MUX. No external components are required to configure the device as all inputs can be connected directly to  $V_{CC}$  or  $\overline{GND}$ . The 3-state output is controlled by the output enable input ( $\overline{OE}$ ). A HIGH level at  $\overline{OE}$  causes the output (Y) to assume a high-impedance OFF-state. When  $\overline{OE}$  is LOW, the output state is determined by the signals applied to the Schmitt trigger inputs (A, B, C and D).

Due to the use of Schmitt trigger inputs the device is tolerant of slowly changing input signals, transforming them into sharply defined, jitter free output signals. By eliminating leakage current paths to  $V_{CC}$  and GND, the inputs and disabled output are also over-voltage tolerant, making the device suitable for mixed-voltage applications.

This device is fully specified for partial power-down applications using  $I_{OFF}$ . The  $I_{OFF}$  circuitry disables the output, preventing the damaging backflow current through the device when it is powered down.

The 74LVC1G99 is fully specified over the supply range from 1.65 V to 5.5 V.
