DESCRIPTION

The 74LVT162373 is a high-performance BiCMOS product designed for V_{CC} operation at 3.3 V.

This device is a 16-bit transparent D-type latch with non-inverting 3-State bus compatible outputs. The device can be used as two 8-bit latches or one 16-bit latch. When Latch Enable (LE) input is High, the Q outputs follow the data (D) inputs. When Latch Enable is taken Low, the Q outputs are latched at the levels of the D inputs one setup time prior to the High-to-Low transition.

The 74LVT162373 is designed with 30 Ω series resistance in both the High and Low states of the output. This design reduces the noise in applications such as memory address drivers, clock drivers, and bus receivers/transmitters.

4. Unused pins at V_{CC} or GND.
5. For valid test results, data must not be loaded into the flip-flops (or latches) after applying power.
6. I_{CCZ} is measured with outputs pulled to V_{CC} or GND.
