

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Please note: As part of the Fairchild Semiconductor integration, some of the Fairchild orderable part numbers will need to change in order to meet ON Semiconductor's system requirements. Since the ON Semiconductor product management systems do not have the ability to manage part nomenclature that utilizes an underscore (_), the underscore (_) in the Fairchild part numbers will be changed to a dash (-). This document may contain device numbers with an underscore (_). Please check the ON Semiconductor website to verify the updated device numbers. 8-Bit Dual Supply Translating Transceiver with 3-STATE Outputs

General Description

The LVX4245 is a dual-supply, 8-bit translating transceiver that is designed to interface between a 5V bus and a 3V bus in a mixed 3V/5V supply environment. The Transmit/Receive (T/\bar{R}) input determines the direction of data flow. Transmit (active-HIGH) enables data from A Ports to B Ports; Receive (active-LOW) enables data from B Ports to A Ports. The Output Enable input, when HIGH, disables both A and B Ports by placing them in a high impedance condition. The A Port interfaces with the 5V bus; the B Port interfaces with the 3V bus.

The LVX4245 is suitable for mixed voltage applications such as laptop computers using 3.3V CPU's and 5V LCD displays.

Features

- Bidirectional interface between 5V and 3V buses
- Control inputs compatible with TTL level
- 5V data flow at A Port and 3V data flow at B Port
- Outputs source/sink 24 mA at 5V bus; 12 mA at 3V bus
- Guaranteed simultaneous switching noise level and dynamic threshold performance
- Implements patented EMI reduction circuitry
- Functionally compatible with the 74 series 245

8-Bit Dual Supply Translating Transceiver

The LVX4245 is a dual supply device capable of bidirectional signal translation. This level shifting ability provides an efficient interface between low voltage CPU local bus with memory and a standard bus defined by 5V I/O levels. The device control inputs can be controlled by either the low voltage CPU and core logic or a bus arbitrator with 5V I/O levels.

Manufactured on a sub-micron CMOS process, the LVX4245 is ideal for mixed voltage applications such as notebook computers using 3.3V CPU's and 5V peripheral devices.

Power Up Considerations

To insure the system does not experience unnecessary I_{CC} current draw, bus contention, or oscillations during power up, the following guidelines should be adhered to (refer to Table 1):

- Power up the control side of the device first. This is the V_{CCA}.
- \overline{OE} should ramp with or ahead of V_{CCA}. This will help guard against bus contention.
- The Transmit/Receive control pin (T/\overline{R}) should ramp with or ahead of V_{CCA}, this will ensure that the A Port data

pins are configured as inputs. With V_{CCA} receiving power first, the A I/O Port should be configured as inputs to help guard against bus contention and oscillations.

- A side data inputs should be driven to a valid logic level. This will prevent excessive current draw.

The above steps will ensure that no bus contention or oscillations, and therefore no excessive current draw occurs during the power up cycling of these devices. These steps will help prevent possible damage to the translator devices and potential damage to other system components.

TABLE 1. Low Voltage Translator Power Up Sequencing Table

| Device Type | V _{CCA} | V _{CCB} | T/ \overline{R} | \overline{OE} | A Side I/O | B Side I/O | Floatable Pin Allowed |

Please reference Application Note AN-5001 for more detailed information on using Fairchild's LVX Low Voltage Dual Supply CMOS Translating Transceivers.

Applications: Mixed Mode Dual Supply Interface Solution

L VX4245 is designed to solve 3V/5V interfacing issues when CMOS devices cannot tolerate I/O levels above their applied V_{CC} . If an I/O pin of 3V ICs is driven by 5V ICs, the P-Channel transistor in 3V ICs will conduct causing current flow from I/O bus to the 3V power supply. The resulting high current flow can cause destruction of 3V ICs through latchup effects. To prevent this problem, a current limiting resistor is used typically under direct connection of 3V ICs and 5V ICs, but it causes speed degradation.

In a better solution, the LVX4245 configures two different output levels to handle the dual supply interface issues. The "A" port is a dedicated 5V port to interface 5V ICs. The "B" port is a dedicated port to interface 3V ICs. *Figure 2* shows how LVX4245 fits into a system with 3V subsystem and 5V subsystem.

This device is also configured as an 8-bit 245 transceiver, giving the designer 3-STATE capabilities and the ability to select either bidirectional or unidirectional modes. Since the center 20 pins are also pin compatible to 74 series 245, as shown in *Figure 1*, the designer could use this device in

either a 3V system or a 5V system without any further work to re-layout the board.
