Chipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

1.8V CONFIGURABLE BUFFER WITH ADDRESS-PARITY TEST

IDT74SSTU32866B

FEATURES:
- 1.8V Operation
- SSTL_18 style clock and data inputs
- Differential CLK input
- Configurable as 25-bit 1:1 or 14-bit 1:2 registered buffer
- Control inputs compatible with LVCMOS levels
- Flow-through architecture for optimum PCB design
- Latch-up performance exceeds 100mA
- ESD >2000V per MIL-STD-883, Method 3015; >200V using machine model (C = 200pF, R = 0)
- Checks parity on data inputs
- Available in 96-pin LFBGA package

APPLICATIONS:
- Along with CSPU877/A/D DDR2-400 PLL, provides complete solution for DDR2-400/533 DIMMs
- Optimized for DDR2-400/533 (PC2-3200/4300) JEDEC Raw Cards E, F, and G

DESCRIPTION:
This 25-bit 1:1 / 14-bit 1:2 configurable registered buffer is designed for 1.7V to 1.9V VDD operation. In the 1:1 pinout configuration, only one device per DIMM is requred to drive nine SDRAM loads. In the 1:2 pinout configuration, two devices per DIMM are required to drive eighteen SDRAM loads. All inputs are SSTL_18, except reset ($\overline{RESET}$) and control (Cn) inputs, which are LVCMOS. All outputs are edge-controlled circuits optimized for unterminated DIMM loads, and meet SSTL_18 specifications, except the open-drain error ($\overline{QERR}$) output.

The SSTU32866B operates from a differential clock (CLK and $\overline{CLK}$). Data are registered at the crossing of CLK going high and $\overline{CLK}$ going low. Parity is checked on the parity bit (PAR_IN) input which arrives one cycle after the input data to which it applies. The $\overline{QERR}$ output is open drain.

When used as a single device, the C0 and C1 inputs are tied low. In this configuration, the partial-parity-out (PPO) and $\overline{QERR}$ signals are produced two clock cycles after the corresponding data output.

When used in pairs, the C0 input of the first register is tied low and the C0 input of the second register is tied high. The C1 input of both registers are tied high. The $\overline{QERR}$ output of the first SSTU32866B is left floating and the valid error information is latched on the $\overline{QERR}$ output of the second SSTU32866B.

If an error occurs and the $\overline{QERR}$ output is driven low, it stays latched low for two clock cycles or until $\overline{RESET}$ is driven low. The DIMM-dependent signals (DODT, DCKE, $\overline{DCS}$, and $\overline{CSR}$) are not included in the parity check.

The CO input controls the pinout configuration of the 1:2 pinout from register A configuration (when low) to register B configuration (when high). The C1 input controls the pinout configuration from 25-bit 1:1 (when low) to 14-bit 1:2 (when high). C0 and C1 should not be switched during normal operation. They should be hard-wired to a valid low or high level to configure the register in the desired mode. In the 25-bit 1:1 pinout configuration, the A6, D6, and H6 terminals are driven low and should not be used.
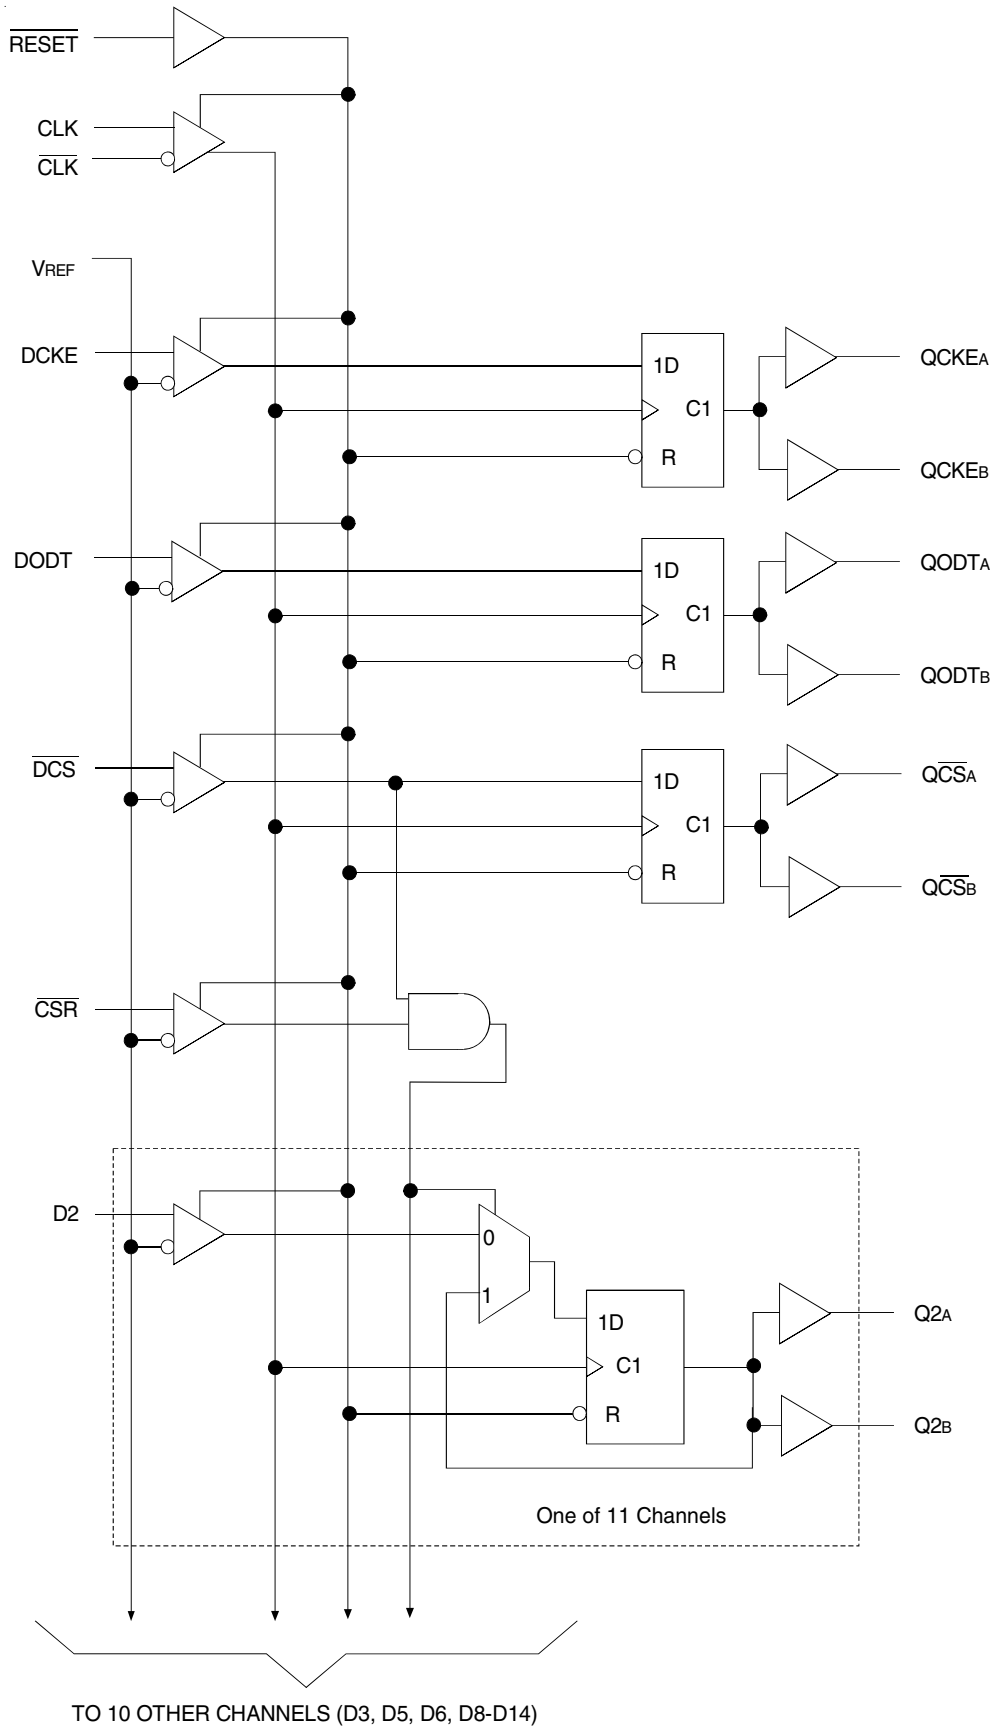

The device supports low-power standby operation. When $\overline{RESET}$ is low, the differential input recievers are disabled, and undriven (floating) data, clock, and reference voltage (VREF) inputs are allowed. In addition, when $\overline{RESET}$ is low, all registers are reset and all outputs except $\overline{QERR}$ are forced low. The LVCMOS $\overline{RESET}$ and Cn inputs always must be held at a valid logic high or low level.

There are two VREF pins (A3 and T3). However, it is necessary to only connect one of the two VREF pins to the external VREF power supply. An unused VREF pin should be terminated with a VREF coupling capacitor.
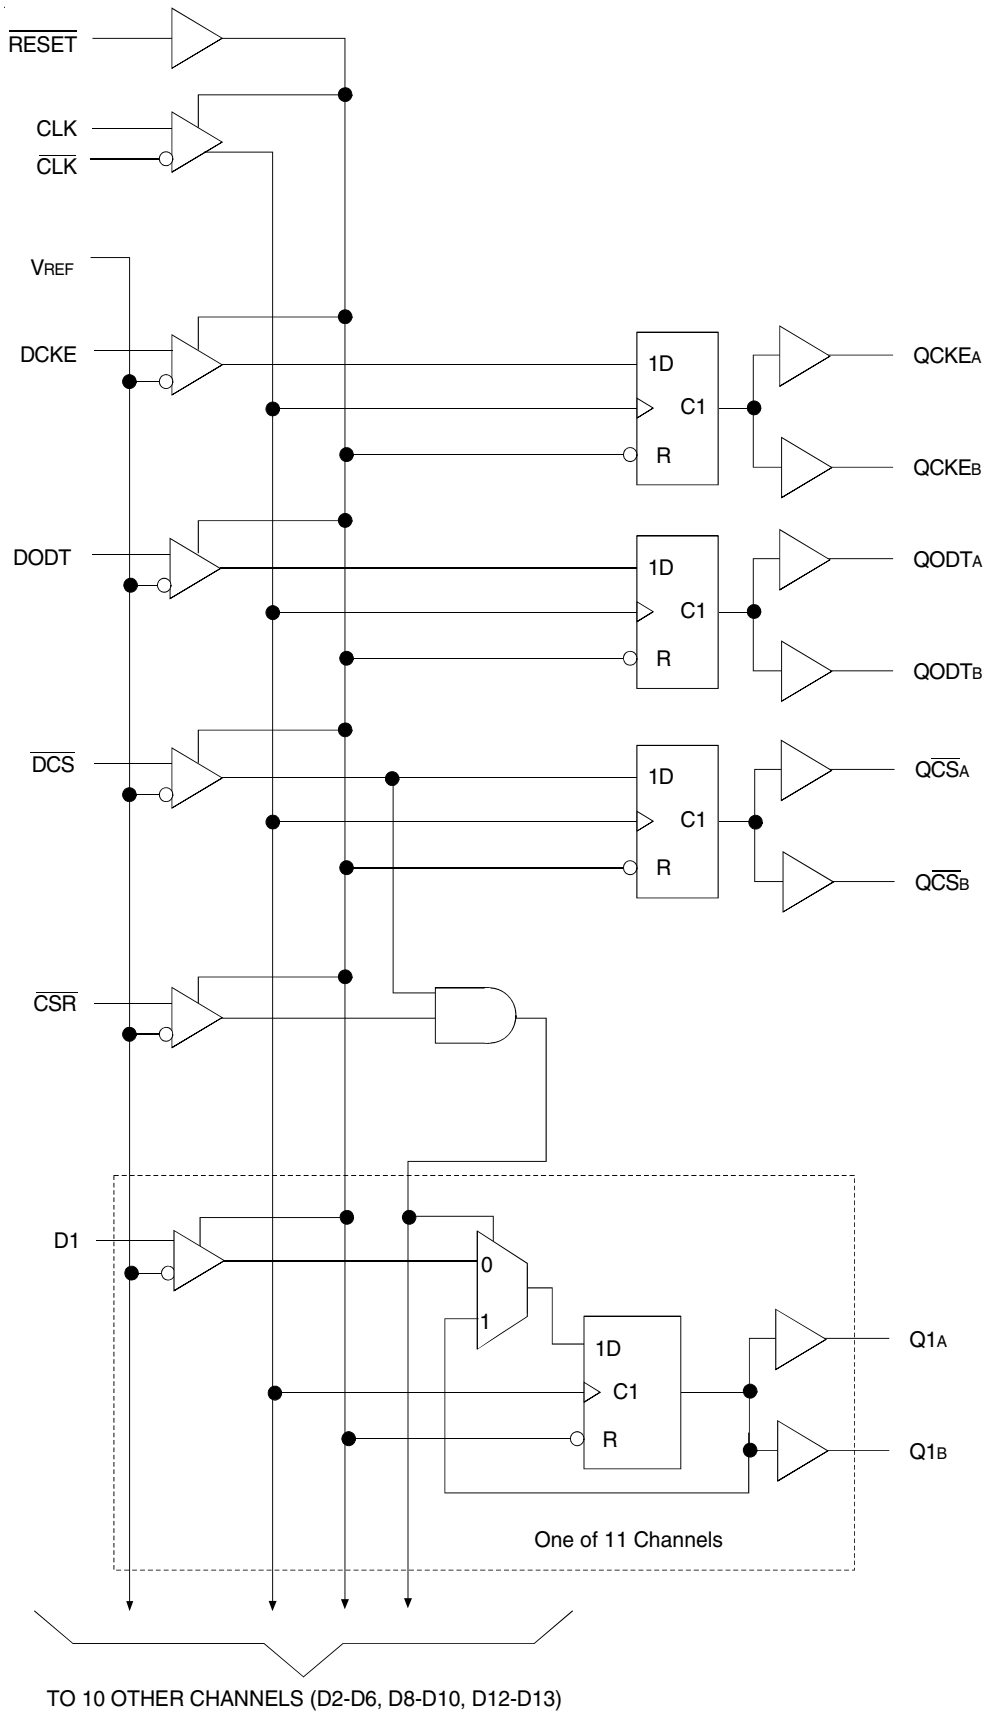

The device also supports low-power active operation by monitoring both system chip select ($\overline{DCS}$ and $\overline{CSR}$) inputs and will gate the Qn and PPO outputs from changing states when both $\overline{DCS}$ and $\overline{CSR}$ inputs are high. If either $\overline{DCS}$ or $\overline{CSR}$ input is low, the Qn and PPO outputs will function normally. Also, if the internal low power signal ($\overline{LPS1}$) is high, the device will gate the $\overline{QERR}$ output from changing states. If $\overline{LPS1}$ is low, the $\overline{QERR}$ output will function normally. The $\overline{RESET}$ input has priority over the $\overline{DCS}$ and $\overline{CSR}$ control and when driven low will force the Qn and PPO outputs low, and the $\overline{QERR}$ output high. If the $\overline{DCS}$ control functionality is not desired, then the $\overline{CSR}$ input can be hard-wired to ground, in which case the setup-time requirement for $\overline{DCS}$ would be the same as for the other D data inputs. To control the low-power mode with $\overline{DCS}$ only, then the $\overline{CSR}$ input should be pulled up to VDD through a pullup resistor.

To ensure defined outputs from the register before a stable clock has been supplied, $\overline{RESET}$ must be held in the low state during power up.

NOTES:
1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. The input and output negative voltage ratings may be exceeded if the ratings of the I/P and O/P clamp current are observed.
3. This value is limited to 2.5V maximum.
