

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Description

This 25-bit 1:1 or 14-bit 1:2 configurable registered buffer is designed for 1.425V to 1.575V VDD operation.

The control inputs are LVCMOS. All outputs are 1.5-V CMOS drivers that have been optimized to drive the DDR-II DIMM load. IDT74SSTUAE32866A operates from a differential clock (CLK and $\overline{\text{CLK}}$). Data are registered at the crossing of CLK going high, and $\overline{\text{CLK}}$ going low.

The C0 input controls the pinout configuration of the 1:2 pinout from A configuration (when low) to B configuration (when high). The C1 input controls the pinout configuration from 25-bit 1:1 (when low) to 14-bit 1:2 (when high).

A - Pair Configuration (C01 = 0, C11 = 1 and C02 = 0, C12 = 1)

Parity that arrives one cycle after the data input to which it applies is checked on the PAR_IN of the first register. The second register produces PPO and QERR signals. The QERR of the first register is left floating. The valid error information is latched on the QERR output of the second register. If an error occurs QERR is latched low for two cycles or until RESET is low.

B - Single Configuration (C0 = 0, C1 = 0)

The device supports low-power standby operation. When the RESET input ($\overline{\text{RESET}}$) is low, the differential input receivers are disabled, and undriven (floating) data, clock and reference voltage (VREF) inputs are allowed. In addition, when $\overline{\text{RESET}}$ is low all registers are reset, and all outputs are forced low. The LVCMOS $\overline{\text{RESET}}$ and Cn inputs must always be held at a valid logic high or low level. To ensure defined outputs from the register before a stable clock has been supplied, $\overline{\text{RESET}}$ must be held in the low state during power up.

In the DDR-II RDIMM application, $\overline{\text{RESET}}$ is specified to be completely asynchronous with respect to CLK and $\overline{\text{CLK}}$. Therefore, no timing relationship can be guaranteed between the two. When entering reset, the register will be cleared and the outputs will be driven low quickly, relative to the time to disable the differential input receivers. However, when coming out of reset, the register will become active quickly, relative to the time to enable the differential input receivers. As long as the data inputs are low, and the clock is stable during the time from the low-to-high transition of $\overline{\text{RESET}}$ until the input receivers are fully enabled, the design of the IDT74SSTUAE32866A must ensure that the

outputs will remain low, thus ensuring no glitches on the output.

The device monitors both $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ inputs and will gate the Qn outputs from changing states when both $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ inputs are high. If either $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ input is low, the Qn outputs will function normally. The $\overline{\text{RESET}}$ input has priority over the $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ control and will force the outputs low. If the $\overline{\text{DCS}}$ -control functionality is not desired, then the $\overline{\text{CSR}}$ input can be hardwired to ground, in which case, the setup-time requirement for $\overline{\text{DCS}}$ would be the same as for the other D data inputs. Package options include 96-ball LFBGA (MO-205CC).

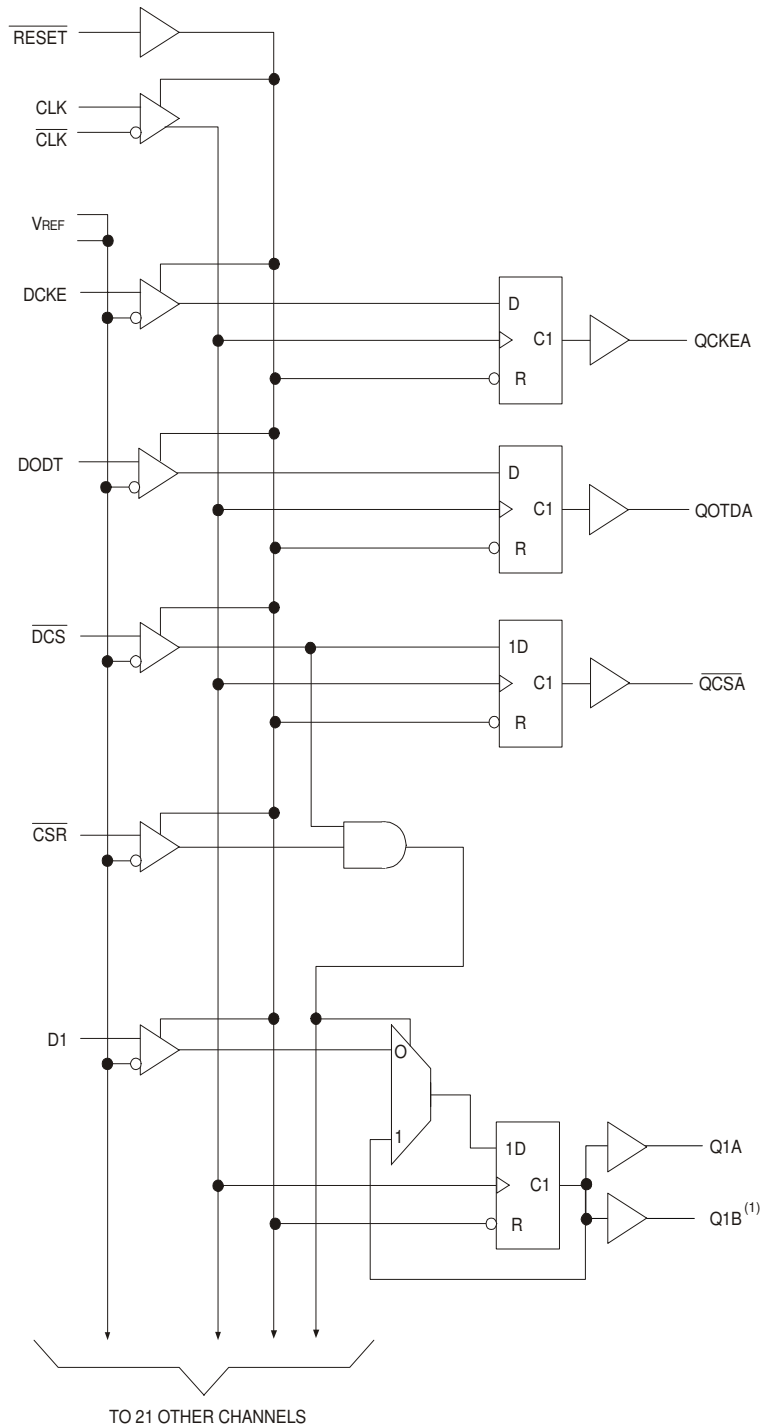

Features

- Supports 1.5V VDD operation for DDR2 DIMMs
- 25-bit 1:1 or 14-bit 1:2 registered buffer with parity check functionality
- Supports LVCMOS switching levels on C0, C1, and $\overline{\text{RESET}}$ inputs
- Low voltage operation: VDD = 1.425V to 1.575V
- Available in 96-ball LFBGA package

Applications

- DDR2 Memory Modules running at 1.5V VDD
- Provides complete DDR DIMM solution with ICS98UAE877A
- Ideal for DDR2 667

↓ = HIGH to LOW

Data Inputs = D2, D3, D5, D6, D8 - D25 when C0 = 0 and C1 = 0.

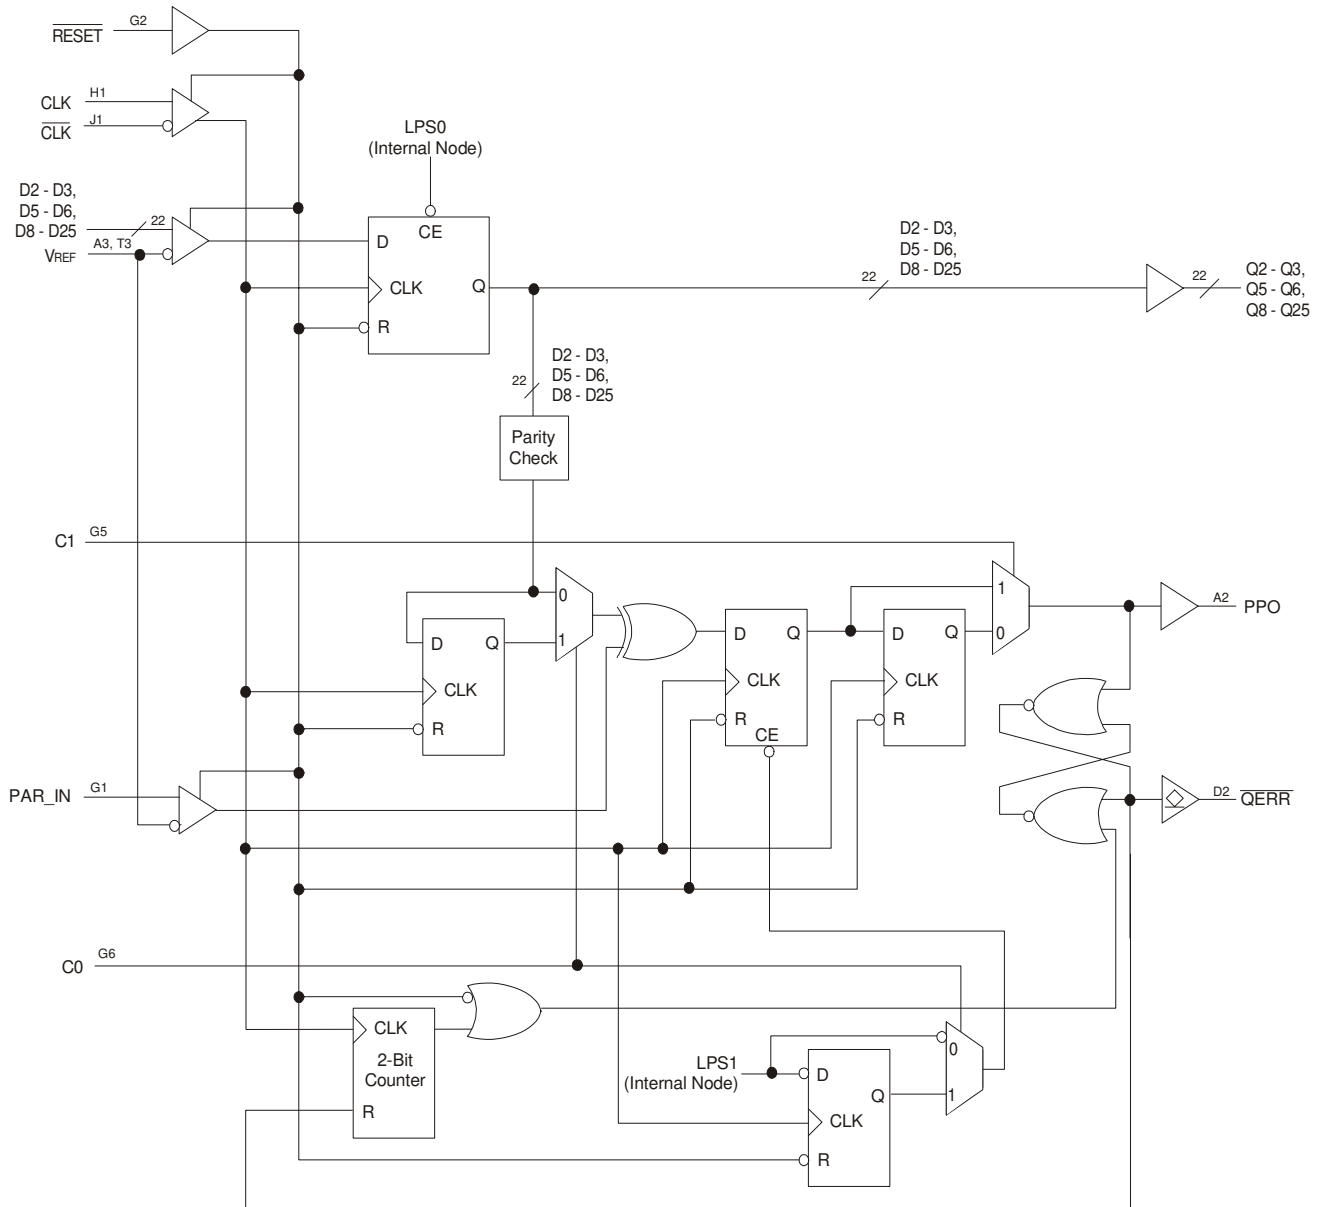

Data Inputs = D2, D3, D5, D6, D8 - D14 when C0 = 0 and C1 = 1.

Data Inputs = D1 - D6, D8 - D10, D12, D13 when C0 = 1 and C1 = 1.

2 PAR_IN arrives one clock cycle after the data to which it applies when C0 = 0, and two clock cycles when C0 = 1.

3 This transition assumes $\overline{\text{QERR}}$ is HIGH at the crossing of CLK going HIGH and $\overline{\text{CLK}}$ going LOW. If $\overline{\text{QERR}}$ is LOW, it stays latched LOW for two clock cycles or until $\overline{\text{RESET}}$ is driven LOW.

Logic Diagram (1:1)

Parity Logic Diagram for 1:1 Register Configuration (Positive Logic); C0 = 0, C1 = 0

Absolute Maximum Ratings

Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Item		Rating
Supply Voltage, VDD		-0.5V to 2.5V
Input Voltage Range, Vi ¹		-0.5V to 2.5V
Output Voltage Range, Vo ^{1,2}		-0.5V to VDD + 0.5V
Input Clamp Current, IiK		±50mA
Output Clamp Current, IoK		±50mA
Continuous Output Clamp Current, Io		±50mA
Continuous Current through each VDD or GND		±100mA
Package Thermal Impedance (θ_{ja}) ³	0m/s Airflow	70.9° C/W
	1m/s Airflow	65° C/W
Storage Temperature		-65 to +150° C

1 The input and output negative voltage ratings may be exceeded if the ratings of the I/P and O/P clamp current are observed.

2 This current will flow only when the output is in the high state level $V_O > V_{DDQ}$.

3 The package thermal impedance is calculated in accordance with JESD 51.

Terminal Functions

Terminal Name	Electrical Characteristics	Description
GND	Ground Input	Ground
VDD	1.5V nominal	Power Supply Voltage
VREF	0.75V nominal	Input Reference Clock
ZOH	Input	Reserved for future use
ZOL	Input	Reserved for future use
CLK	Differential Input	Positive Master Clock Input
$\overline{\text{CLK}}$	Differential Input	Negative Master Clock Input
C0, C1	LVC MOS Input	Configuration Control Inputs
$\overline{\text{RESET}}$	LVC MOS Input	Asynchronous Reset Input. Resets registers and disables VREF data and clock differential-input receivers.
$\overline{\text{CSR}}, \overline{\text{DCS}}$	1.5V Input	Chip Select Inputs. Disables outputs D1 - D24 output switching when both inputs are HIGH.
D1 - D25	1.5V Input	Data Input. Clocked in on the crossing of the rising edge of CLK and the falling edge of $\overline{\text{CLK}}$.
DODT	1.5V Input	The outputs of this register bit will not be suspended by the $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ controls
DCKE	1.5V Input	The outputs of this register bit will not be suspended by the $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ controls
Q1 - Q25	1.5V CMOS	Data Outputs that are suspended by the $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ controls
$\overline{\text{QCS}}$	1.5V CMOS	Data Output that will not be suspended by the $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ controls
QODT	1.5V CMOS	Data Output that will not be suspended by the $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ controls
QCKE	1.5V CMOS	Data Output that will not be suspended by the $\overline{\text{DCS}}$ and $\overline{\text{CSR}}$ controls
PPO	1.5V CMOS	Partial Parity Output. Indicates off parity of D1 - D25
PAR_IN	1.5V Input	Parity Input arrives one cycle after corresponding data input
$\overline{\text{QERR}}$	Open Drain Output	Output Error bit, generated one cycle after the corresponding data output

Operating Characteristics

The $\overline{\text{RESET}}$ and Cn inputs of the device must be held at valid levels (not floating) to ensure proper device operation. The differential inputs must not be floating unless $\overline{\text{RESET}}$ is LOW.

Symbol	Parameter		Min.	Typ.	Max.	Units
VDDQ	I/O Supply Voltage		1.425	1.5	1.575	V

IOL	Low-Level Output Current				6	
IERRLOL	$\overline{\text{QERR}}$ LOW Level Output Current		25			mA
TA	Operating Free-Air Temperature		0		+70	°C

DC Electrical Characteristics Over Operating Range

Following Conditions Apply Unless Otherwise Specified:

Operating Condition: $T_A = 0^{\circ}\text{C}$ to $+70^{\circ}\text{C}$, $V_{DD} = 1.425\text{V}$ to 1.575V .

Symbol	Parameter	Test Conditions	Min.	Typ.	Max.	Units
V_{IK}		$I_I = -18\text{mA}$			-1.2	V
V_{OH}	Output HIGH Voltage	$I_{OH} = -6\text{mA}$	$V_{DD} - 0.4$			V
V_{OL}	Output LOW Voltage	$I_{OL} = 6\text{mA}$			0.4	V
V_{ERROL}	\overline{QERR} Output LOW Voltage	$I_{ERROL} = 25\text{mA}$, $V_{DD} = 1.425\text{V}$			0.4	V
I_{IL}	All Inputs	$V_I = V_{DD}$ or GND; $V_{DD} = 1.575\text{V}$	-5		+5	μA
I_{DD}	Static Standby	$I_O = 0$, $V_{DD} = 1.575\text{V}$, $\overline{RESET} = \text{GND}$			100	μA
	Static Operating	$I_O = 0$, $V_{DD} = 1.575\text{V}$, $\overline{RESET} = V_{DD}$, $V_I = V_{IH(AC)}$ or $V_{IL(AC)}$, $\text{CLK} = \overline{\text{CLK}} = V_{IH(AC)}$ or $V_{IL(AC)}$			20	mA
$I_O = 0$, $V_{DD} = 1.575\text{V}$, $\overline{RESET} = V_{DD}$, $V_I = V_{IH(AC)}$ or $V_{IL(AC)}$, $\text{CLK} = V_{IH(AC)}$, $\overline{\text{CLK}} = V_{IL(AC)}$			80			
I_{DDD}	Dynamic Operating (clock only)	$I_O = 0$, $V_{DD} = 1.5\text{V}$, $\overline{RESET} = V_{DD}$, $V_I = V_{IH(AC)}$ or $V_{IL(AC)}$, CLK and $\overline{\text{CLK}}$ switching 50% duty cycle		170		$\mu\text{A}/\text{Clock MHz}$
	Dynamic Operating (per each data input)	$I_O = 0$, $V_{DD} = 1.5\text{V}$, $\overline{RESET} = V_{DD}$, $V_I = V_{IH(AC)}$ or $V_{IL(AC)}$, CLK and $\overline{\text{CLK}}$ switching 50% duty cycle. One data input switching at half clock frequency, 50% duty cycle.	1:1 mode		50	$\mu\text{A}/\text{Clock MHz}/\text{Data Input}$
			1:2 mode		90	
C_{IN}	Data Inputs	$V_I = V_{REF} \pm 0.175$	2		3	pF
	CLK and $\overline{\text{CLK}}$	$V_{ICR} = 0.75\text{V}$, $V_{IPP} = 360\text{mV}$	2		3	
	\overline{RESET}	$V_I = V_{DD}$ or GND		5		

Timing Requirements Over Recommended Operating Free-Air Temperature Range

Symbol	Parameter	V _{DD} = 1.5V ± 0.075V		Units
		Min.	Max.	
f _{CLOCK}	Clock Frequency		410	MHz
t _w	Pulse Duration, CLK, $\overline{\text{CLK}}$ HIGH or LOW	1		ns
t _{ACT} ¹	Differential Inputs Active Time		10	ns
t _{INACT} ²	Differential Inputs Inactive Time		15	ns
t _{SU}	Setup Time	$\overline{\text{DCS}}$ before CLK \uparrow , $\overline{\text{CLK}}\downarrow$, $\overline{\text{CSR}}$ HIGH; $\overline{\text{CSR}}$ before CLK \uparrow , $\overline{\text{CLK}}\downarrow$, $\overline{\text{DCS}}$ HIGH	0.7	ns
		$\overline{\text{DCS}}$ before CLK \uparrow , $\overline{\text{CLK}}\downarrow$, $\overline{\text{CSR}}$ LOW	0.5	
		DODT, DOCKE, and data before CLK \uparrow , $\overline{\text{CLK}}\downarrow$	0.5	
		PAR_IN before CLK \uparrow , $\overline{\text{CLK}}\downarrow$	0.5	
t _H	Hold Time	$\overline{\text{DCS}}$, DODT, DCKE, and data after CLK \uparrow , $\overline{\text{CLK}}\downarrow$	0.5	ns
		PAR_IN after CLK \uparrow , $\overline{\text{CLK}}\downarrow$	0.5	

1 V_{REF} must be held at a valid input voltage level and data inputs must be held at valid logic levels for a minimum time of t_{ACT}(max) after $\overline{\text{RESET}}$ is taken HIGH.

2 V_{REF}, data, and clock inputs must be held at a valid input voltage levels (not floating) for a minimum time of t_{INACT}(max) after $\overline{\text{RESET}}$ is taken LOW.

Switching Characteristics Over Recommended Free Air Operating Range (unless otherwise noted)

Symbol	Parameter	V _{DD} = 1.5V ± 0.075V		Units
		Min.	Max.

NOTES:

1. If the data is clocked in on the n clock pulse, the \overline{QERR} output signal will be generated on the n+1 clock pulse, and it will be valid on the n+2 clock pulse. If an error occurs and the \overline{QERR} output is driven low, it stays latched low for a minimum of two clock cycles or until \overline{RESET} is driven low.
2. $\overline{PAR_IN}$ is driven from PPO of the first SSTUAF32866 device.

Register Timing

Timing Diagram for the First IDT74SSTUAE32866A (1:2 Register-A Configuration) Device Used in a Pair; C0 = 1, C1 = 1; $\overline{\text{RESET}}$ Switches from H to L

NOTE:

1. After $\overline{\text{RESET}}$ is switched from HIGH to LOW, all data and clock inputs signals must be set and held at valid logic levels (not floating) for a minimum time of t_{INACTMAX} .
