

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Low Voltage 16-Bit Dual Supply Translating Transceiver with 3-STATE Outputs

General Description

The VCX164245 is a dual supply, 16-bit translating transceiver that is designed for two way asynchronous communication between busses at different supply voltages by providing true signal translation. The supply rails consist of V_{CCB} , which is the higher potential rail operating at 2.3V to 3.6V and V_{CCA} , which is the lower potential rail operating at 1.65V to 2.7V. (V_{CCA} must be less than or equal to V_{CCB} for proper device operation.) This dual supply design allows for translation from 1.8V to 2.5V busses to busses at a higher potential, up to 3.3V.

The Transmit/Receive (T/\bar{R}) input determines the direction of data flow. Transmit (active-HIGH) enables data from A Ports to B Ports. Receive (active-LOW) enables data from B Ports to A Ports. The Output Enable (\bar{OE}) input, when HIGH, disables both A and B Ports by placing them in a High-Z condition. The A Port interfaces with the lower voltage bus (1.8V – 2.5V). The B Port interfaces with the higher voltage bus (2.7V – 3.3V). Also the VCX164245 is designed so that the control pins (T/\bar{R}_n , \bar{OE}_n) are supplied by V_{CCB} .

The 74VCX164245 is suitable for mixed voltage applications such as notebook computers using a 1.8V CPU and 3.3V peripheral components. It is fabricated with an Advanced CMOS technology to achieve high speed operation while maintaining low CMOS power dissipation.

Features

- Bidirectional interface between busses ranging from 1.65V to 3.6V
- Supports Live Insertion and Withdrawal (Note 1)
- Static Drive (I_{OH}/I_{OL})
 - ±24 mA @ 3.0V V_{CC}
 - ±18 mA @ 2.3V V_{CC}
 - ±6 mA @ 1.65V V_{CC}
- Uses proprietary noise/EMI reduction circuitry
- Functionally compatible with 74 series 16245
- Latchup performance exceeds 300 mA
- ESD performance:
 - Human Body Model >2000V
 - Machine model >200V
- Also packaged in plastic Fine-Pitch Ball Grid Array (FBGA)

Note 1: To ensure the high impedance state during power up or power down, \bar{OE}_n should be tied to V_{CCB} through a pull up resistor. The minimum value of the resistor is determined by the current sourcing capability of the driver.

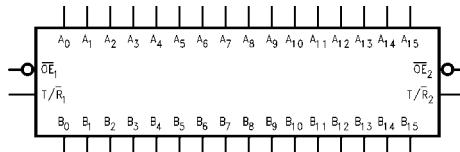

Ordering Code:

Order Number	Package Number	Package Description
74VCX164245G (Note 2)(Note 3)	BGA54A	54-Ball Fine-Pitch Ball Grid Array (FBGA), JEDEC MO-205, 5.5mm Wide
74VCX164245MTD (Note 3)	MTD48	48-Lead Thin Shrink Small Outline Package (TSSOP), JEDEC MO-153, 6.1mm Wide

Note 2: Ordering Code "G" indicates Trays.

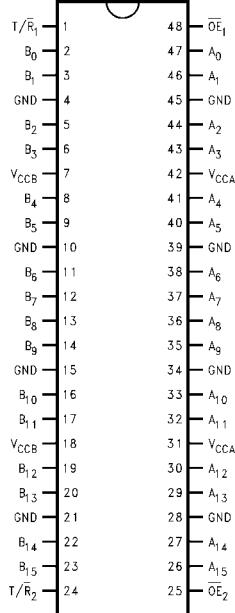

Note 3: Device also available in Tape and Reel. Specify by appending suffix letter "X" to the ordering code.

Translator Power Up Sequence Recommendations

To guard against power up problems, some simple guidelines need to be adhered to. The VCX164245 is designed so that the control pins (T/R_n, OE_n) are supplied by V_{CCB}. Therefore the first recommendation is to begin by powering up the control side of the device, V_{CCB}. The OE_n control pins should be ramped with or ahead of V_{CCB}; this will guard against bus contentions and oscillations as all A Port and B Port outputs will be disabled. To ensure the high impedance state during power up or power down, OE_n should be tied to V_{CCB} through a pull up resistor. The minimum value of the resistor is determined by the current

sourcing capability of the driver. Second, the T/R_n control pins should be placed at logic low (0V) level, this will ensure that the B-side bus pins are configured as inputs to help guard against bus contention and oscillations. B-side Data Inputs should be driven to a valid logic level (0V or V_{CCB}), this will prevent excessive current draw and oscillations. V_{CCA} can then be powered up after V_{CCB}, but should never exceed the V_{CCB} voltage level. Upon completion of these steps the device can then be configured for the users desired operation. Following these steps will help to prevent possible damage to the translator device as well as other system components.

Physical Dimensions inches (millimeters) unless otherwise noted

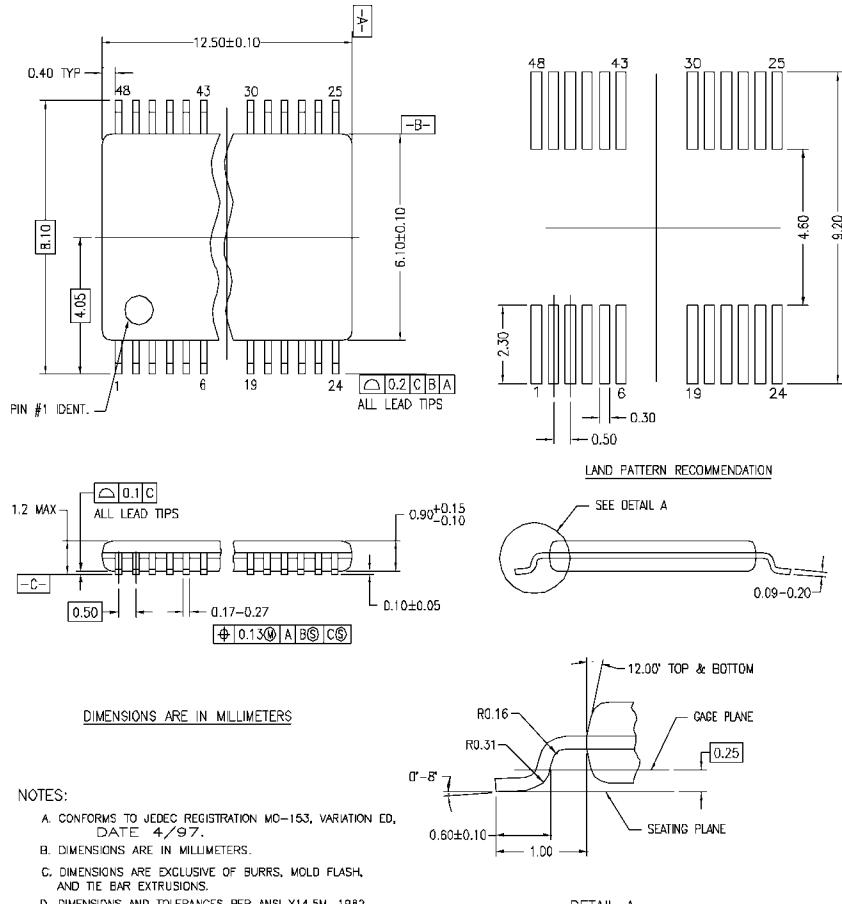

NOTES:

- A. THIS PACKAGE CONFORMS TO JEDEC M0-205
- B. ALL DIMENSIONS IN MILLIMETERS
- C. LAND PATTERN RECOMMENDATION: NSMD (Non Solder Mask Defined)
.35MM DIA PADS WITH A SOLDERMASK OPENING OF .45MM CONCENTRIC TO PADS
- D. DRAWING CONFORMS TO ASME Y14.5M-1994

LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
