## : ©hipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation, and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## Connection Diagram

## Functional Description

The 74VCXH162373 contains sixteen edge D-type latches with 3-STATE outputs. The device is byte controlled with each byte functioning identically, but independent of the other. Control pins can be shorted together to obtain full 16 -bit operation. The following description applies to each byte. When the Latch Enable ( $\mathrm{LE}_{\mathrm{n}}$ ) input is HIGH, data on the $I_{n}$ enters the latches. In this condition the latches are transparent, i.e., a latch output will change state each time

Truth Tables

| Inputs |  |  | Outputs |
| :---: | :---: | :---: | :---: |

| $\mathrm{LE}_{\mathbf{2}}$ | $\overline{\mathrm{OE}}_{\mathbf{2}}$ | $\mathrm{I}_{\mathbf{8}} \mathbf{- I}_{15}$ | $\mathrm{O}_{\mathbf{8}}-\mathrm{O}_{\mathbf{1 5}}$ |
| X | H | X | Z |
| H | L | L | L |
| H | L | H | H |
| L | L | X | $\mathrm{O}_{0}$ |

H = HIGH Voltage Level
L = LOW Voltage Level
X = Immaterial (HIGH or LOW, control inputs may not float)
= High Impedance
$\mathrm{O}_{0}=$ Previous $\mathrm{O}_{0}$ before HIGH-to-LOW of Latch Enable
its I input changes. When $L E_{n}$ is LOW, the latches store information that was present on the I inputs a setup time preceding the HIGH-to-LOW transition on $L E_{n}$. The 3-STATE outputs are controlled by the Output Enable $\left(\overline{\mathrm{OE}}_{\mathrm{n}}\right)$ input. When $\overline{\mathrm{OE}}_{n}$ is LOW the standard outputs are in the 2-state mode. When $\overline{\mathrm{OE}}_{\mathrm{n}}$ is HIGH, the standard outputs are in the high impedance mode but this does not interfere with entering new data into the latches.

Note 2: The Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the Absolute Maximum Ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.
Note 3: $\mathrm{I}_{\mathrm{O}}$ Absolute Maximum Rating must be observed.
Note 4: Floating or unused control inputs must be held HIGH or LOW.
