imall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

74VHCT373A Octal D-Type Latch with 3-STATE Outputs

Features

- High speed: t_{PD} = 7.7ns (Typ.) at T_A = 25°C
- High Noise Immunity: V_{IH} = 2.0V, V_{IL} = 0.8V
- Power Down Protection is provided on all inputs and outputs
- Low Power Dissipation: I_{CC} = 4µA (Max.) @ T_A = 25°C
- Pin and Function Compatible with 74HCT373

General Description

The VHCT373A is an advanced high speed CMOS octal D-type latch with 3-STATE output fabricated with silicon gate CMOS technology. It achieves the high speed operation similar to equivalent Bipolar Schottky TTL while maintaining the CMOS low power dissipation. This 8-bit D-type latch is controlled by a latch enable input (LE) and an output enable input (\overline{OE}). The latches appear transparent to data when latch enable (LE) is HIGH. When LE is LOW, the data that meets the setup time is latched. When the \overline{OE} input is HIGH, the eight outputs are in a high impedance state.

Protection circuits ensure that 0V to 7V can be applied to the input and output⁽¹⁾ pins without regard to the supply voltage. This device can be used to interface 3V to 5V systems and two supply systems such as battery back up. This circuit prevents device destruction due to mismatched supply and input voltages.

Note:

1. Outputs in OFF-State

 $O_0 = \mbox{Previous} \ O_0$ before HIGH-to-LOW transition of Latch Enable

Functional Description

The VHCT373A contains eight D-type latches with 3-STATE standard outputs. When the Latch Enable (LE) input is HIGH, data on the D_n inputs enters the latches. In this condition the latches are transparent, i.e., a latch output will change state each time its D input changes. When LE is LOW, the latches store the information that was present on the D inputs a setup time preceding the

HIGH-to-LOW transition of LE. The 3-STATE standard outputs are controlled by the Output Enable (\overline{OE}) input. When \overline{OE} is LOW, the standard outputs are in the 2-state mode. When \overline{OE} is HIGH, the standard outputs are in the high impedance mode but this does not interfere with entering new data into the latches.

Please note that this diagram is provided only for the understanding of logic operations and should not be used to estimate propagation delays.

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Symbol	Parameter	Rating
V _{CC}	Supply Voltage	–0.5V to +7.0V
V _{IN}	DC Input Voltage	–0.5V to +7.0V
V _{OUT}	DC Output Voltage	
	Note 2	–0.5V to V _{CC} + 0.5V
	Note 3	–0.5V to +7.0V
I _{IK}	Input Diode Current	–20mA
I _{OK}	Output Diode Current ⁽⁴⁾	±20mA
I _{OUT}	DC Output Current	±25mA
I _{CC}	DC V _{CC} /GND Current	±75mA
T _{STG}	Storage Temperature	–65°C to +150°C
TL	Lead Temperature (Soldering, 10 seconds)	260°C

Recommended Operating Conditions⁽⁵⁾

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to absolute maximum ratings.

Symbol	Parameter	Rating
V _{CC}	Supply Voltage	4.5V to +5.5V
V _{IN}	Input Voltage	0V to +5.5V
V _{OUT}	Output Voltage	
	Note 2	0V to V _{CC}
	Note 3	0V to 5.5V
T _{OPR}	Operating Temperature	–40°C to +85°C
t _r , t _f	Input Rise and Fall Time, $V_{CC} = 5.0V \pm 0.5V$	0ns/V ~ 20ns/V

Notes:

2. HIGH or LOW state. I_{OUT} absolute maximum rating must be observed.

3. When outputs are in OFF-State or when $V_{CC} = 0V$.

4. $V_{OUT} < GND$, $V_{OUT} > V_{CC}$ (Outputs Active).

5. Unused inputs must be held HIGH or LOW. They may not float.

C _{OUT}	Output Capacitance		$V_{\rm CC} = 5.0$	/		6				pF
C _{PD}	Power Dissipation Capacitance		(8)			25				pF

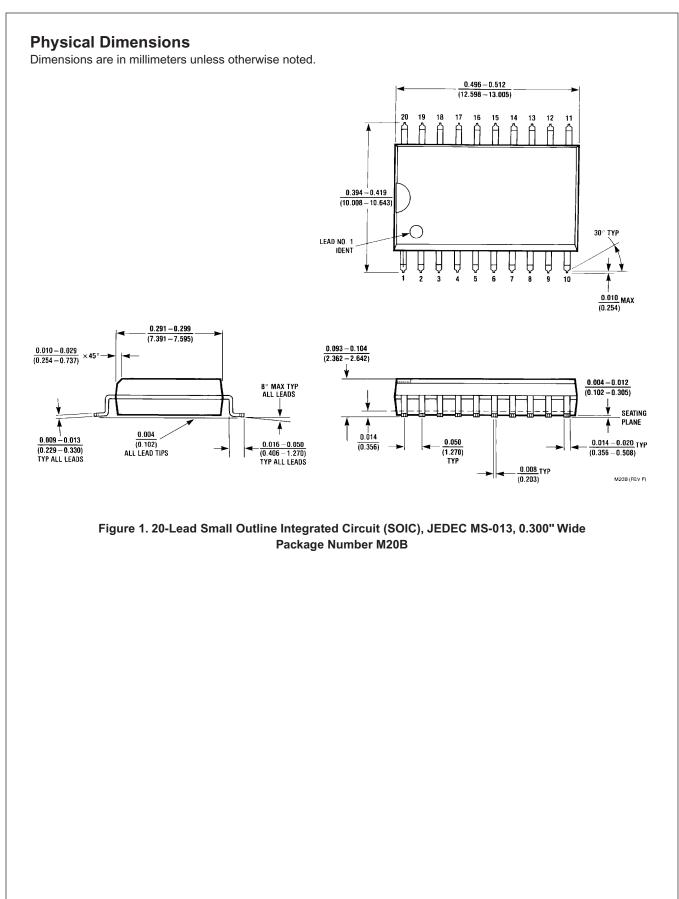

Notes:

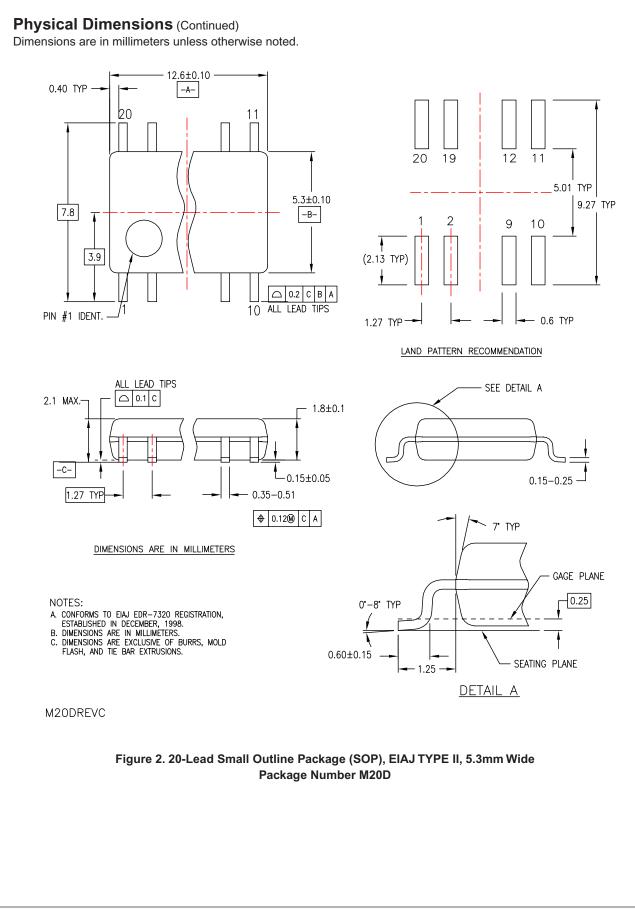

7. Parameter guaranteed by design. $t_{OSLH} = |t_{PLH} \max - t_{PLH \min}|; t_{OSHL} = |t_{PHL \max} - t_{PHL \min}|$

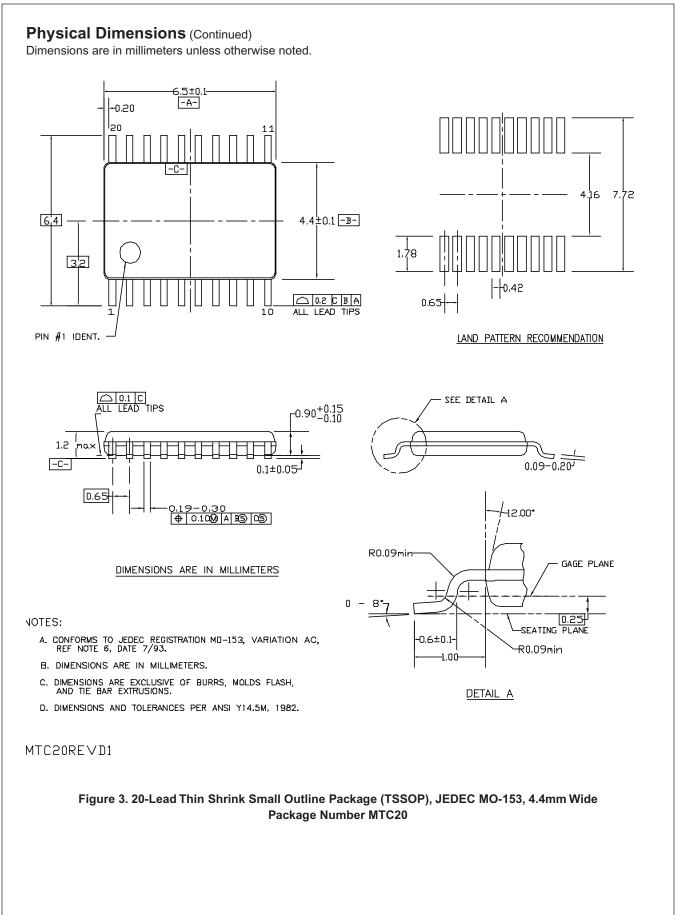

C_{PD} is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load. Average operating current can be obtained by the equation:
I_{CC} (Opr.) = C_{PD} • V_{CC} • f_{IN} + I_{CC} / 8 (per F/F).
