Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

General Description

The 810001-21 is a PLL based synchronous clock generator that is optimized for digital video clock jitter attenuation and frequency translation. The device contains two internal frequency multiplication stages that are cascaded in series. The first stage is a VCXO PLL that is optimized to provide reference clock jitter attenuation, and to support the complex PLL multiplication ratios needed for video rate conversion. The second stage is a FemtoClock™ frequency multiplier that provides the low jitter, high frequency video output clock.

Preset multiplication ratios are selected from internal lookup tables using device input selection pins. The multiplication ratios are optimized to support most common video rates used in professional video system applications. The VCXO requires the use of an external, inexpensive pullable crystal. Two crystal connections are provided (pin selectable) so that both 60 and 59.94 base frame rates can be supported. The VCXO requires external passive loop filter components which are used to set the PLL loop bandwidth and damping characteristics.

Features

- Jitter attenuation and frequency translation of video clock signals
- Supports SMPTE 292M, ITU-R Rec. 601/656 and MPEG-transport clocks
- Support of High-Definition (HD) and Standard-Definition (SD) pixel rates
- Dual VCXO-PLL supports both 60 and 59.94Hz base frame rates in one device
- Supports both 1000/1001 and 1001/1000 rate conversions
- Dual PLL mode for high-frequency clock generation (36MHz to 148.5MHz)
- VCXO-PLL mode for low-frequency clock generation (27MHz and 26.973MHz)
- One LVCMOS/LVTTL clock output
- Two selectable LVCMOS/LVTTL clock inputs
- LVCMOS/LVTTL compatible control signals
- RMS phase jitter @148.3516MHz, (12kHz - 20MHz): 1.089ps (typical)
- 3.3V supply voltage
- 0°C to 70°C ambient operating temperature
- Available in lead-free (RoHS 6) packages

Supported Input Frequencies

f_{VCXO} = 27MHz	f_{VCXO} = 26.973MHz
27.0000MHz	26.9730MHz
27.0270MHz	27.0000MHz
74.1758MHz	74.1016MHz
74.3243MHz	74.2499MHz
74.2500MHz	74.1758MHz
27.0270MHz	27.0000MHz
26.9730MHz	26.9461MHz
74.1758MHz	74.1016kHz
45.0000kHz	44.9550kHz
33.7500kHz	33.7163kHz
15.6250kHz	15.6094kHz
15.7343kHz	15.7185kHz
28.1250kHz	28.0969kHz

Supported Output Frequencies

f_{VCXO} = 27MHz	f_{VCXO} = 26.973MHz
148.5000MHz	148.3515MHz
74.2500MHz	74.1758MHz
49.5000MHz	49.4505MHz
33.0000MHz	32.9670MHz
162.0000MHz	161.8380MHz
81.0000MHz	80.9190MHz
54.0000MHz	53.9460MHz
36.0000MHz	35.9640MHz
27.0000MHz	26.9730MHz

Table 1. Pin Descriptions

Number	Name	Type		Description
1, 2	LF1, LF0	Analog Input/Output		Loop filter connection node pins.
3	ISET	Analog Input/Output		Charge pump current setting pin.
4, 11, 25	V_{DD}	Power		Core supply pins.
5, 22	nBP0, nBP1	Input	Pullup	PLL Bypass control pins. See block diagram.
6, 20, 29	GND	Power		Power supply ground.
7	CLK_SEL	Input	Pulldown	Input clock select. When HIGH selects CLK1. When LOW, selects CLK0. LVCMOS / LVTTL interface levels.
8, 9	CLK1, CLK0	Input	Pulldown	Single-ended clock inputs. LVCMOS/LVTTL interface levels.
10, 14, 15, 16	V0, V1, V2, V3	Input	Pulldown	VCXO PLL divider selection pins. LVCMOS/LVTTL interface levels.
12	MR	Input	Pulldown	Active HIGH Master Reset. When logic HIGH, the internal dividers are reset causing the output to go low. When logic LOW, the internal dividers and the output is enabled. LVCMOS/LVTTL interface levels.
13	MF	Input	Pulldown	FemtoClock multiplication factor select pin. LVCMOS/LVTTL interface levels.
17	V_{DDA}	Power		Analog supply pin.
18	V_{DDO}	Power		Output supply pin.
19	Q	Output		Single-ended VCXO PLL clock output. LVCMOS/LVTTL interface levels.
21	OE	Input	Pullup	Output enable. When logic LOW, the clock output is in high-impedance. When logic HIGH, the output is enabled. LVCMOS/LVTTL interface levels.
23, 24	N1, N0	Input	Pulldown	FemtoClock output divide select pins. LVCMOS/LVTTL interface levels.
26	XTAL_SEL	Input	Pulldown	Crystal select. When HIGH, selects XTAL1. When LOW, selects XTAL0. LVCMOS/LVTTL interface levels.
27, 28	XTAL_OUT1, XTAL_IN1	Input		Crystal oscillator interface. XTAL_IN1 is the input. XTAL_OUT1 is the output.
30, 31	XTAL_OUT0, XTAL_IN0	Input		Crystal oscillator interface. XTAL_IN0 is the input. XTAL_OUT0 is the output.
32	V_{DDX}	Power		Power supply pin for VCXO charge pump.

NOTE: *Pullup and Pulldown* refer to internal input resistors. See Table 2, *Pin Characteristics,* for typical values.

Table 2. Pin Characteristics

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
C_{IN}	Input Capacitance			4		pF
C_{PD}	Power Dissipation Capacitance (per output)	$V_{DD} = V_{DDO} = 3.465V$		8.5		pF
R_{PULLUP}	Input Pullup Resistor			51		kΩ
$R_{PULLDOWN}$	Input Pulldown Resistor			51		kΩ
R_{OUT}	Output Impedance			22.5		Ω

	1	1	0	53.9460
	1	1	1	35.9640

NOTE: Use the VCXO-PLL mode to achieve output Frequencies of 27MHz or 26.973MHz. See Table 3H.

Table 3D. CLK_SEL Function Table

Input	
CLK_SEL	**Operation**
0 (default)	Selects CLK0 as PLL reference input.
1	Selects CLK1 as PLL reference input.

Table 3E. MR Master Reset Function Table

Input	
MR	**Operation**
0 (default)	Normal operation, internal dividers and the output Q are enabled.
1	Internal dividers are reset. Q output is in logic low state (with OE = 1).

Table 3F. FemtoCLock PLL Feedback Divider Function Table

Input	
MF	**Operation**
0 (default)	Selects MF = 22. The 2nd stage PLL (FemtoClock. multiplies the output frequency of the VCXO-PLL by 22.
1	Selects MF = 24. The 2nd stage PLL (FemtoClock. multiplies the output frequency of the VCXO-PLL by 24.

Table 3G. PLL Output Divider Function Table

Input		
N1	**N0**	**Operation**
0 (default)	0 (default)	Output divider N = 4.
0	1	Output divider N = 8.
1	0	Output divider N = 12.
1	1	Output divider N = 18.

Table 3H. PLL BYPASS Logic Function Table

Input		
nBP1	**nBP0**	**Operation**
0	0	VCXO-PLL mode: The input reference frequency is divided by the pre-divider P and is multiplied by the VCXO-PLL. $f_{OUT} = (f_{REF} \div P) * M$.
0	1	Test mode: The input reference frequency is divided by the pre-divider P and the output divider N and bypasses both PLLs. $f_{OUT} = f_{REF} \div (P * N)$.
1	0	FemtoClock Mode: The input reference frequency is divided by the pre-divider P multiplied by the 2nd PLL (FemtoClock, MF). The 1st PLL (VCXO-PLL, M) is bypassed. This mode does not support jitter attenuatiion. $f_{OUT} = (f_{REF} \div P) * MF \div N$.
1 (default)	1 (default)	Dual PLL Mode: both PLLs are cascaded for jitter attenuation and frequency multiplication. $f_{OUT} = (f_{REF} \div P) * M * MF \div N$.

Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics or AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Item	Rating
Supply Voltage, V_{DD}	4.6V
Inputs, V_I XTAL_IN Other Inputs	 0V to V_{DD} -0.5V to V_{DD} + 0.5V
Outputs, V_O	-0.5V to V_{DDO} + 0.5V
Package Thermal Impedance, θ_{JA}	37°C/W (0 mps)
Storage Temperature, T_{STG}	-65°C to 150°C

DC Electrical Characteristics

Table 4A. Power Supply DC Characteristics, $V_{DD} = V_{DDO} = V_{DDX} = 3.3V \pm 5\%$, T_A = 0°C to 70°C

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
V_{DD}	Core Supply Voltage		3.135	3.3	3.465	V
V_{DDA}	Analog Supply Voltage		V_{DD} – 0.15	3.3	V_{DD}	V
V_{DDO}	Output Supply Voltage		3.135	3.3	3.465	V
V_{DDX}	Charge Pump Supply Voltage		V_{DD} – 0.04	3.3	3.465	V
I_{DD}	Power Supply Current				290	mA
I_{DDA}	Analog Supply Current				15	mA
I_{DDO}	Output Supply Current	No Load			4	mA
I_{DDX}	Charge Pump Supply Current				4	mA

Applications Information

Recommendations for Unused Input Pins

Inputs:

CLK Inputs

For applications not requiring the use of a clock input, it can be left floating. Though not required, but for additional protection, a 1kΩ resistor can be tied from the CLK input to ground.

LVCMOS Control Pins

All control pins have internal pullups or pulldowns; additional resistance is not required but can be added for additional protection. A 1kΩ resistor can be used.

Power Supply Filtering Technique

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. To achieve optimum jitter perform ance, power supply isolation is required. The 810001-21 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL. V_{DD}, V_{DDA}, V_{DDO} and V_{DDX} should be individually connected to the power supply plane through vias, and 0.01µF bypass capacitors should be used for each pin. *Figure 1* illustrates this for a generic V_{DD} pin and also shows that V_{DDA} requires that an additional 10Ω resistor along with a 10µF bypass capacitor be connected to the V_{DDA} pin.

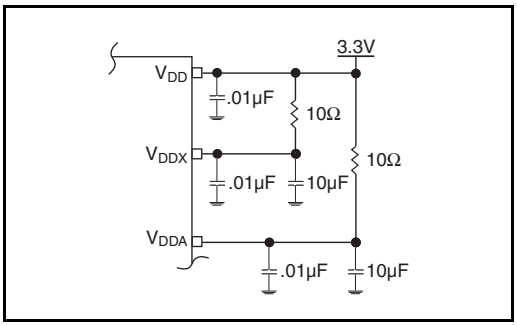

Figure 1. Power Supply Filtering

VFQFN EPAD Thermal Release Path

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in *Figure 2.* The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as “heat pipes”. The number of vias (i.e. “heat pipes”) are application specific and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13mils (0.30 to 0.33mm) with 1oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only. For further information, please refer to the Application Note on the Surface Mount Assembly of Amkor’s Thermally/Electrically Enhance Leadframe Base Package, Amkor Technology.

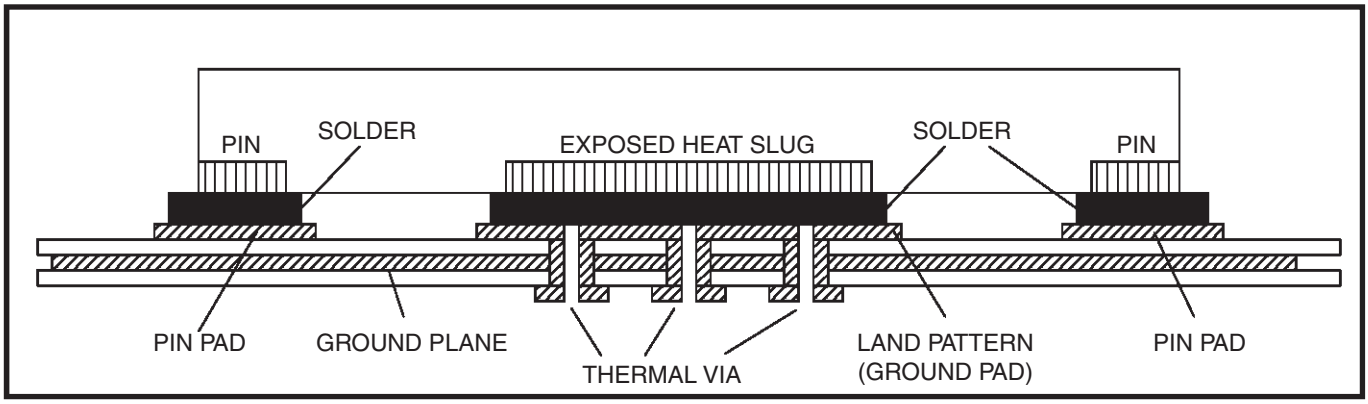

Figure 2. P.C. Assembly for Exposed Pad Thermal Release Path – Side View (drawing not to scale)

Schematic Example

Figure 3 shows an example of the 810001-21 application schematic. In this example, the device is operated at V_{DD} = V_{DDX} = V_{DDO} = V_{DDA}= 3.3V. The decoupling capacitors should be located as close as possible to the power pin. The input is driven by a 3.3V 17Ω LVCMOS driver. An optional 3-pole filter can also be used for additional spur reduction. It is recommended that the loop filter components be laid out for the 3-pole option. This will also allow the 2-pole filter to be used. For the LVCMOS output, a termination example is shown in this schematic. For more termination approaches, please refer to the LVCMOS Termination Application Note.

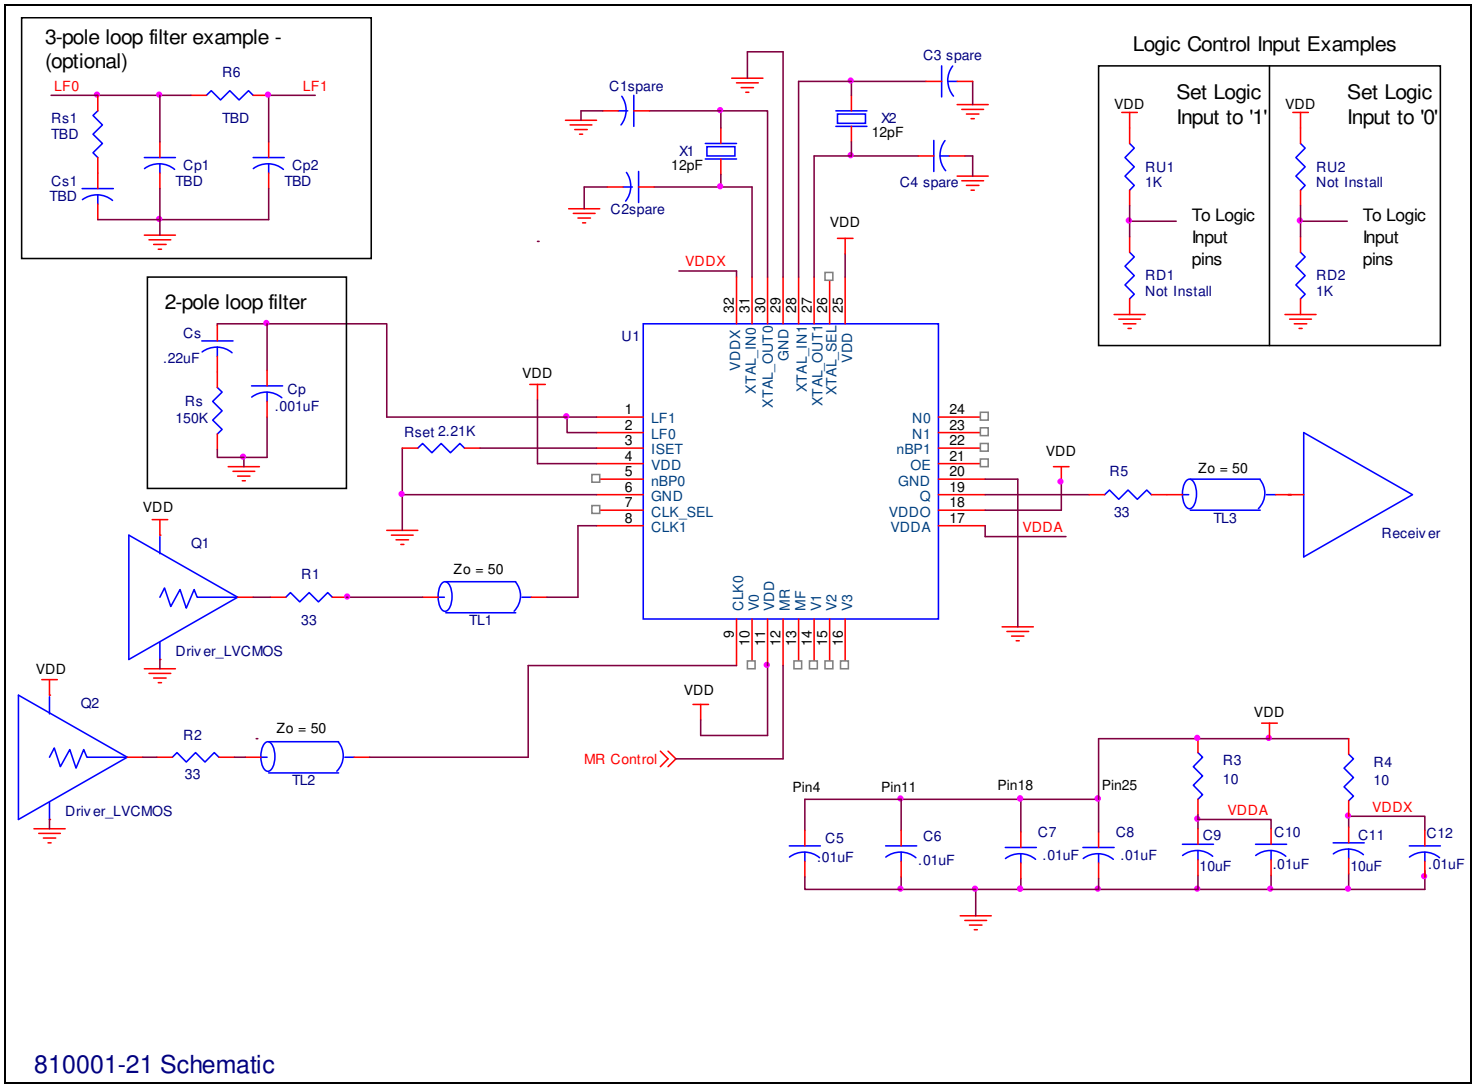

Figure 3. 810001-21 Schematic Example

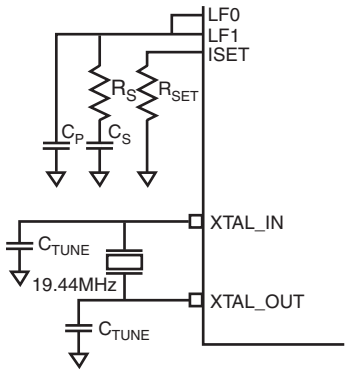
VCXO-PLL External Components

Choosing the correct external components and having a proper printed circuit board (PCB) layout is a key task for quality operation of the VCXO-PLL. In choosing a crystal, special precaution must be taken with the package and load capacitance (C_L). In addition, frequency, accuracy and temperature range must also be considered. Since the pulling range of a crystal also varies with the package, it is recommended that a metal-canned package like HC49 be used. Generally, a metal-canned package has a larger pulling range than a surface mounted device (SMD). For crystal selection information, refer to the *VCXO Crystal Selection Application Note.*

The crystal's load capacitance C_L characteristic determines its resonating frequency and is closely related to the VCXO tuning range. The total external capacitance seen by the crystal when installed on a board is the sum of the stray board capacitance, IC package lead capacitance, internal varactor capacitance and any installed tuning capacitors (C_{TUNE}).

If the crystal C_L is greater than the total external capacitance, the VCXO will oscillate at a higher frequency than the crystal specification. If the crystal C_L is lower than the total external capacitance, the VCXO will oscillate at a lower frequency than the crystal specification. In either case, the absolute tuning range is reduced. The correct value of C_L is dependent on the characteristics of the VCXO. The recommended C_L in the Crystal Parameter Table balances the tuning range by centering the tuning curve.

The frequency of oscillation in the third overtone mode is not necessarily at exactly three times the fundamental frequency. The mechanical properties of the quartz element dictate the position of the overtones relative to the fundamental. The oscillator circuit may excite both the fundamental and overtone modes simultaneously. This will cause a nonlinearity in the tuning curve.



This potential problem is why VCXO crystals are required to be tested for absence of any activity inside a ±200ppm window at three times the fundamental frequency. Refer to F_{L_3OVT} and $F_{L\_3OVT\_spurs}$ in the crystal Characteristics table.

The crystal and external loop filter components should be kept as close as possible to the device. Loop filter and crystal traces should be kept short and separated from each other. Other signal traces should be kept separate and not run underneath the device, loop filter or crystal components.

VCXO Characteristics Table

Symbol	Parameter	Typical	Units
k_{VCXO}	VCXO Gain	6.6	kHz/V
C_{V_LOW}	Low Varactor Capacitance	15	pF
C_{V_HIGH}	High Varactor Capacitance	29	pF

VCXO-PLL Loop Bandwidth Selection Table

Bandwidth	Crystal Frequency (MHz)	M	R_S (kΩ)	C_S (µF)	C_P (µF)	R_{SET} (kΩ)
6Hz (Low)	27	4004	175	4.7	0.01	8.0
80Hz (Mid)	27	1000	150	0.22	0.001	2.21
