

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

**3000 MHz UltraCMOS® Integer-N PLL
For Low Phase Noise Applications
Military Operating Temperature Range**

Features

- 3.0 GHz operation
- $\div 10/11$ dual modulus prescaler
- Internal phase detector
- Serial, parallel or hardwired programmable
- Ultra-low phase noise
- Available in 44-lead CQFJ

Product Description

Peregrine’s PE83336 is a high performance integer-N PLL capable of frequency synthesis up to 3.0 GHz. The superior phase noise performance of the PE83336 makes it ideal for rugged military environments including: radio handsets, radar, avionics, missiles, etc.

The PE83336 features a 10/11 dual modulus prescaler, counters and a phase comparator as shown in Figure 1. Counter values are programmable through either a serial or parallel interface and can also be directly hard wired.

The PE83336 Phase Locked-Loop is optimized for stringent military environments. It is manufactured on Peregrine’s UltraCMOS® process, a patented variation of silicon-on-insulator (SOI) technology on a sapphire substrate, offering the performance of GaAs with the economy and integration of conventional CMOS.

44-lead CQFJ

Table 1. Pin Descriptions

Pin No. (44-lead CQFJ)	Pin Name	Interface Mode	Type	Description
1	V _{DD}	ALL	(Note 1)	Power supply input. Input may range from 2.85 V to 3.15 V. Bypassing recommended.
2	R ₀	Direct	Input	R Counter bit0 (LSB).
3	R ₁	Direct	Input	R Counter bit1.
4	R ₂	Direct	Input	R Counter bit2.
5	R ₃	Direct	Input	R Counter bit3.
6	GND	ALL	(Note 1)	Ground.
7	D ₀	Parallel	Input	Parallel data bus bit0 (LSB).
	M ₀	Direct	Input	M Counter bit0 (LSB).
8	D ₁	Parallel	Input	Parallel data bus bit1.
	M ₁	Direct	Input	M Counter bit1.
9	D ₂	Parallel	Input	Parallel data bus bit2.
	M ₂	Direct	Input	M Counter bit2.
10	D ₃	Parallel	Input	Parallel data bus bit3.
	M ₃	Direct	Input	M Counter bit3.
11	V _{DD}	ALL	(Note 1)	Same as pin 1.
12	V _{DD}	ALL	(Note 1)	Same as pin 1.
13	S_WR	Serial	Input	Serial load enable input. While S_WR is “low”, Sdata can be serially clocked. Primary register data are transferred to the secondary register on S_WR or Hop_WR rising edge.
	D ₄	Parallel	Input	Parallel data bus bit4
	M ₄	Direct	Input	M Counter bit4

Table 1. Pin Descriptions (continued)

Pin No. (44-lead CQFJ)	Pin Name	Interface Mode	Type	Description
14	Sdata	Serial	Input	Binary serial data input. Input data entered MSB first.
	D ₅	Parallel	Input	Parallel data bus bit5.
	M ₅	Direct	Input	M Counter bit5.
15	Sclk	Serial	Input	Serial clock input. Sdata is clocked serially into the 20-bit primary register (E_WR “low”) or the 8-bit enhancement register (E_WR “high”) on the rising edge of Sclk.
	D ₆	Parallel	Input	Parallel data bus bit6.
	M ₆	Direct	Input	M Counter bit6.
16	FSELS	Serial	Input	Selects contents of primary register (FSELS=1) or secondary register (FSELS=0) for programming of internal counters while in Serial Interface Mode.
	D ₇	Parallel	Input	Parallel data bus bit7 (MSB).
	$\overline{\text{Pre_en}}$	Direct	Input	Prescaler enable, active “low”. When “high”, F _{in} bypasses the prescaler.
17	GND	ALL		Ground.
18	FSELP	Parallel	Input	Selects contents of primary register (FSELP=1) or secondary register (FSELP=0) for programming of internal counters while in Parallel Interface Mode.
	A ₀	Direct	Input	A Counter bit0 (LSB).
19	E_WR	Serial	Input	Enhancement register write enable. While E_WR is “high”, Sdata can be serially clocked into the enhancement register on the rising edge of Sclk.
		Parallel	Input	Enhancement register write. D[7:0] are latched into the enhancement register on the rising edge of E_WR.
	A ₁	Direct	Input	A Counter bit1.
20	M2_WR	Parallel	Input	M2 write. D[3:0] are latched into the primary register (R[5:4], M[8:7]) on the rising edge of M2_WR.
	A ₂	Direct	Input	A Counter bit2.
21	Smode	Serial, Parallel	Input	Selects serial bus interface mode ($\overline{\text{Bmode}}=0$, Smode=1) or Parallel Interface Mode ($\overline{\text{Bmode}}=0$, $\overline{\text{Smode}}=0$).
	A ₃	Direct	Input	A Counter bit3 (MSB).
22	$\overline{\text{Bmode}}$	ALL	Input	Selects direct interface mode ($\overline{\text{Bmode}}=1$).
23	V _{DD}	ALL	(Note 1)	Same as pin 1.
24	M1_WR	Parallel	Input	M1 write. D[7:0] are latched into the primary register ($\overline{\text{Pre_en}}$, M[6:0]) on the rising edge of M1_WR.
25	A_WR	Parallel	Input	A write. D[7:0] are latched into the primary register (R[3:0], A[3:0]) on the rising edge of A_WR.
26	Hop_WR	Serial, Parallel	Input	Hop write. The contents of the primary register are latched into the secondary register on the rising edge of Hop_WR.
27	F _{in}	ALL	Input	Prescaler input from the VCO. 3.0 GHz max frequency.
28	$\overline{\text{F}}_{\text{in}}$	ALL	Input	Prescaler complementary input. A bypass capacitor should be placed as close as possible to this pin and be connected in series with a 50 Ω resistor directly to the ground plane.
29	GND	ALL		Ground.

Table 1. Pin Descriptions (continued)

Pin No. (44-lead CQFJ)	Pin Name	Interface Mode	Type	Description
30	f_p	ALL	Output	Monitor pin for main divider output. Switching activity can be disabled through enhancement register programming or by floating or grounding V_{DD} pin 31.
31	V_{DD-f_p}	ALL	(Note 1)	V_{DD} for f_p . Can be left floating or connected to GND to disable the f_p output.
32	Dout	Serial, Parallel	Output	Data Out. The MSEL signal and the raw prescaler output are available on Dout through enhancement register programming.
33	V_{DD}	ALL	(Note 1)	Same as pin 1.
34	Cext	ALL	Output	Logical "NAND" of $PD_{\bar{U}}$ and $PD_{\bar{D}}$ terminated through an on chip, 2 k Ω series resistor. Connecting Cext to an external capacitor will low pass filter the input to the inverting amplifier used for driving LD.
35	V_{DD}	ALL	(Note 1)	Same as pin 1.
36	$PD_{\bar{D}}$	ALL	Output	$PD_{\bar{D}}$ is pulse down when f_p leads f_c .
37	$PD_{\bar{U}}$	ALL		$PD_{\bar{U}}$ is pulse down when f_c leads f_p .
38	V_{DD-f_c}	ALL	(Note 1)	V_{DD} for f_c can be left floating or connected to GND to disable the f_c output.
39	f_c	ALL	Output	Monitor pin for reference divider output. Switching activity can be disabled through enhancement register programming or by floating or grounding V_{DD} pin 38.
40	GND	ALL		Ground.
41	GND	ALL		Ground.
42	f_r	ALL	Input	Reference frequency input.
43	LD	ALL	Output	Lock detect and open drain logical inversion of CEXT. When the loop is in lock, LD is high impedance, otherwise LD is a logic low ("0").
44	$\bar{E}n\bar{h}$	Serial, Parallel	Input	Enhancement mode. When asserted low ("0"), enhancement register bits are functional.
N/A	NC	ALL		No connection.

Note 1: All V_{DD} pins are connected by diodes and must be supplied with the same positive voltage level.

V_{DD-f_p} and V_{DD-f_c} are used to power the f_p and f_c outputs and can alternatively be left floating or connected to GND to disable the f_p and f_c outputs.

Note 2: All digital input pins have 70 k Ω pull-down resistors to ground.

Table 2. Absolute Maximum Ratings

Symbol	Parameter/Conditions	Min	Max	Units
V_{DD}	Supply voltage	-0.3	4.0	V
V_I	Voltage on any input	-0.3	$V_{DD} + 0.3$	V
I_I	DC into any input	-10	+10	mA
I_O	DC into any output	-10	+10	mA
T_{stg}	Storage temperature range	-65	150	°C

Table 3. Operating Ratings

Symbol	Parameter/Conditions	Min	Max	Units
V_{DD}	Supply voltage	2.85	3.15	V
T_A	Operating ambient temperature range	-55	125	°C

Table 4. ESD Ratings

Symbol	Parameter/Conditions	Level	Units
V_{ESD}	ESD voltage (Human Body Model)	1000	V

Note 1: Periodically sampled, not 100% tested. Tested per MIL-STD-883, M3015 C2

Electrostatic Discharge (ESD) Precautions

When handling this UltraCMOS[®] device, observe the same precautions that you would use with other ESD-sensitive devices. Although this device contains circuitry to protect it from damage due to ESD, precautions should be taken to avoid exceeding the specified rating in Table 4.

Latch-Up Avoidance

Unlike conventional CMOS devices, UltraCMOS[®] devices are immune to latch-up.

Table 5. DC Characteristics: $V_{DD} = 3.0\text{ V}$, $-55^\circ\text{ C} \leq T_A \leq 125^\circ\text{ C}$, unless otherwise specified

Symbol	Parameter	Conditions	Min	Typ	Max	Units
I_{DD}	Operational supply current; Prescaler disabled Prescaler enabled	$V_{DD} = 2.85\text{ to }3.15\text{ V}$		10 20	28	mA mA
Digital Inputs: All except f_r, R_0, F_{in}, \overline{F}_{in}						
V_{IH}	High level input voltage	$V_{DD} = 2.85\text{ to }3.15\text{ V}$	$0.7 \times V_{DD}$			V
V_{IL}	Low level input voltage	$V_{DD} = 2.85\text{ to }3.15\text{ V}$			$0.3 \times V_{DD}$	V
I_{IH}	High level input current	$V_{IH} = V_{DD} = 3.15\text{ V}$			+70	μA
I_{IL}	Low level input current	$V_{IL} = 0, V_{DD} = 3.15\text{ V}$	-1			μA
Reference Divider input: f_r						
I_{IHR}	High level input current	$V_{IH} = V_{DD} = 3.15\text{ V}$			+100	μA
I_{ILR}	Low level input current	$V_{IL} = 0, V_{DD} = 3.15\text{ V}$	-100			μA
R0 Input (Pull-up Resistor): R_0						
I_{IHRO}	High level input current	$V_{IH} = V_{DD} = 3.15\text{ V}$			+70	μA
I_{ILRO}	Low level input current	$V_{IL} = 0, V_{DD} = 3.15\text{ V}$	-5			μA
Counter and phase detector outputs: f_c, f_p, $PD_{\overline{D}}$, $PD_{\overline{U}}$						
V_{OLD}	Output voltage LOW	$I_{out} = 6\text{ mA}$			0.4	V
V_{OHD}	Output voltage HIGH	$I_{out} = -3\text{ mA}$	$V_{DD} - 0.4$			V
Lock detect outputs: C_{ext}, LD						
V_{OLC}	Output voltage LOW, C_{ext}	$I_{out} = 100\mu\text{A}$			0.4	V
V_{OHC}	Output voltage HIGH, C_{ext}	$I_{out} = -100\mu\text{A}$	$V_{DD} - 0.4$			V
V_{OLLD}	Output voltage LOW, LD	$I_{out} = 6\text{ mA}$			0.4	V

Table 6. AC Characteristics: $V_{DD} = 3.0\text{ V}$, $-55^{\circ}\text{ C} \leq T_A \leq 125^{\circ}\text{ C}$, unless otherwise specified

Symbol	Parameter	Conditions	Min	Typ	Max	Units
Control Interface and Latches (see Figures 4, 5, 6)

V_{fr}	Input sensitivity	External AC coupling (Note 3)	0.5			V_{p-p}
Phase Detector						
f_c	Comparison frequency	(Note 1)			20	MHz
SSB Phase Noise : Output Referred ($F_{in} = 1918\text{MHz}$, $f_r = 10\text{ MHz}$, $f_c = 1\text{MHz}$, $\text{LBW} = 70\text{ kHz}$)						
PN_{OR}	Output Referred Phase Noise	100 Hz Offset: $V_{DD} = 3.0\text{V}$, $T = 25^{\circ}\text{C}$		-78	(Note 4)	dBc/Hz
PN_{OR}	Output Referred Phase Noise	1000 Hz Offset: $V_{DD} = 3.0\text{V}$, $T = 25^{\circ}\text{C}$		-84	(Note 4)	dBc/Hz
PN_{OR}	Output Referred Phase Noise	10000 Hz Offset: $V_{DD} = 3.0\text{V}$, $T = 25^{\circ}\text{C}$		-87	(Note 4)	dBc/Hz

Note 1: Parameter is guaranteed through characterization only and is not tested.

Note 2: Running at low frequencies ($< 10\text{ MHz}$ sinewave), the device will still be functional but may cause phase noise degradation. Inserting a low-noise amplifier to square up the edges is recommended at lower input frequencies.

Note 3: CMOS logic levels may be used if DC coupled. For optimum phase noise performance, the reference input falling edge rate should be faster than 80mV/ns .

Note 4: All devices are screened to phase noise limits listed in Table 7. The magnitude of the tester uncertainty precludes testing phase noise as part of qualification testing. These parameters are also exempt from PDA requirements.

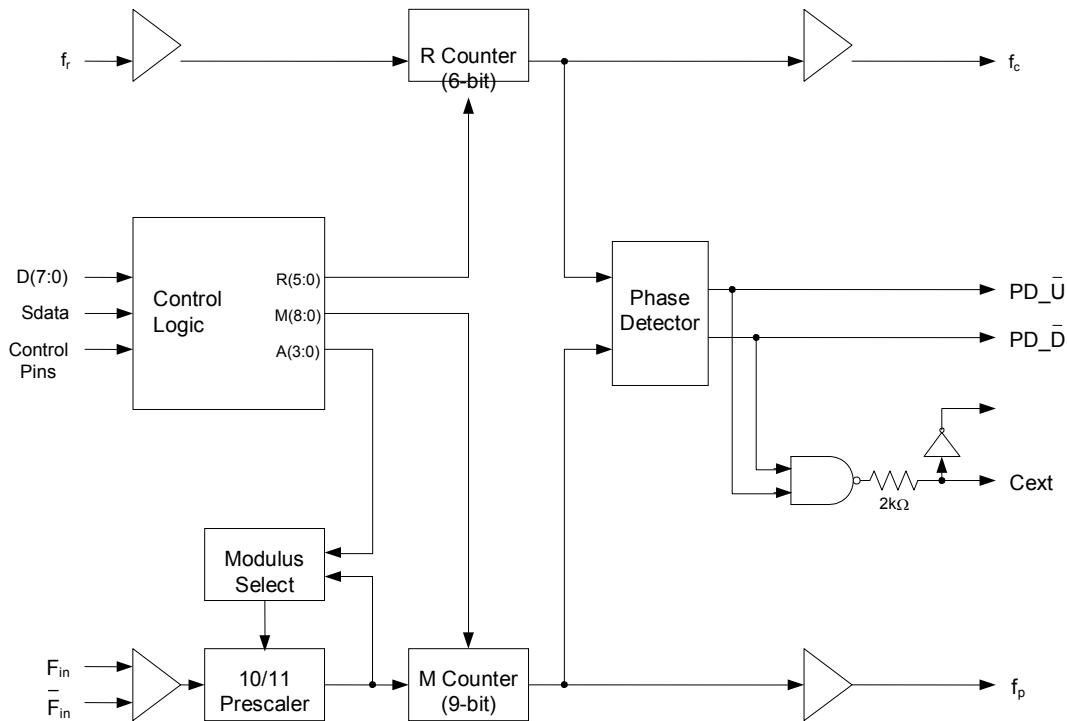

Note 5: Parameter is tested using 100pF load capacitance and is guaranteed through characterization only. Typical test delay is 12ns .

Functional Description

The PE83336 consists of a prescaler, counters, a phase detector and control logic. The dual modulus prescaler divides the VCO frequency by either 10 or 11, depending on the value of the modulus select. Counters “R” and “M” divide the reference and prescaler output, respectively, by integer values stored in a 20-bit register. An additional counter (“A”) is used in the modulus select logic. The phase-frequency detector

generates up and down frequency control signals. The control logic includes a selectable chip interface. Data can be written via serial bus, parallel bus, or hardwired direct to the pins. There are also various operational and test modes and lock detect.

Figure 4. Functional Block Diagram

Main Counter Chain

The main counter chain divides the RF input frequency, F_{in} , by an integer derived from the user defined values in the “M” and “A” counters. It is composed of the 10/11 dual modulus prescaler, modulus select logic, and 9-bit M counter. Setting $\overline{Pre_en}$ “low” enables the 10/11 prescaler. Setting $\overline{Pre_en}$ “high” allows F_{in} to bypass the prescaler and powers down the prescaler.

The output from the main counter chain, f_p , is related to the VCO frequency, F_{in} , by the following equation:

$$f_p = F_{in} / [10 \times (M + 1) + A] \quad (1)$$

where $A \leq M + 1$, $1 \leq M \leq 511$

When the loop is locked, F_{in} is related to the reference frequency, f_r , by the following equation:

$$F_{in} = [10 \times (M + 1) + A] \times (f_r / (R+1)) \quad (2)$$

where $A \leq M + 1$, $1 \leq M \leq 511$

A consequence of the upper limit on A is that F_{in} must be greater than or equal to $90 \times (f_r / (R+1))$ to obtain contiguous channels. Programming the M Counter with the minimum value of “1” will result in a minimum M Counter divide ratio of “2”.

When the prescaler is bypassed, the equation becomes:

$$F_{in} = (M + 1) \times (f_r / (R+1)) \quad (3)$$

where $1 \leq M \leq 511$

In Direct Interface Mode, main counter inputs M_7 and M_8 are internally forced low.

Reference Counter

The reference counter chain divides the reference frequency, f_r , down to the phase detector comparison frequency, f_c .

The output frequency of the 6-bit R Counter is related to the reference frequency by the following equation:

$$f_c = f_r / (R + 1) \quad (4)$$

where $0 \leq R \leq 63$

Note that programming R equal to “0” will pass the reference frequency, f_r , directly to the phase detector.

In Direct Interface Mode, R Counter inputs R4 and R5 are internally forced low (“0”).

Register Programming

Parallel Interface Mode

Parallel Interface Mode is selected by setting the \overline{Bmode} input “low” and the \overline{Smode} input “low”.

Parallel input data, D[7:0], are latched in a parallel fashion into one of three, 8-bit primary register sections on the rising edge of $M1_WR$, $M2_WR$, or A_WR per the mapping shown in Table 7 on page 9. The contents of the primary register are transferred into a secondary register on the rising edge of Hop_WR according to the timing diagram shown in Figure 5. Data are transferred to the counters as shown in Table 7 on page 9.

The secondary register acts as a buffer to allow rapid changes to the VCO frequency. This double buffering for “ping-pong” counter control is programmed via the \overline{FSELP} input. When \overline{FSELP} is “high”, the primary register contents set the counter inputs. When \overline{FSELP} is “low”, the secondary register contents are utilized.

Parallel input data, D[7:0], are latched into the enhancement register on the rising edge of E_WR according to the timing diagram shown in Figure 5. This data provides control bits as shown in Table 8 on page 9 with bit functionality enabled by asserting the \overline{Enh} input “low”.

Serial Interface Mode

Serial Interface Mode is selected by setting the \overline{Bmode} input “low” and the \overline{Smode} input “high”.

While the $\overline{E_WR}$ input is “low” and the $\overline{S_WR}$ input is “low”, serial input data (Sdata input), B_0 to B_{19} , are clocked serially into the primary register on the rising edge of $Sclk$, MSB (B_0) first. The contents from the primary register are transferred into the secondary register on the rising edge of either $\overline{S_WR}$ or Hop_WR according to the timing diagram shown in Figures 5-6. Data are transferred to the counters as shown in Table 7 on page 9.

The double buffering provided by the primary and secondary registers allows for “ping-pong” counter control using the \overline{FSELS} input. When \overline{FSELS} is “high”, the primary register contents set the counter inputs. When \overline{FSELS} is “low”, the secondary register contents are utilized.

While the E_WR input is “high” and the S_WR input is “low”, serial input data (Sdata input), B₀ to B₇, are clocked serially into the enhancement register on the rising edge of Sclk, MSB (B₀) first. The enhancement register is double buffered to prevent inadvertent control changes during serial loading, with buffer capture of the serially entered data performed on the falling edge of E_WR according to the timing diagram shown in Figure 6. After the falling edge of E_WR, the data provide control bits as shown in Table 8 with bit functionality enabled by asserting the $\overline{\text{Enh}}$ input “low”.

Direct Interface Mode

Direct Interface Mode is selected by setting the $\overline{\text{Bmode}}$ input “high”.

Counter control bits are set directly at the pins as shown in Table 8. In Direct Interface Mode, main counter inputs M₇ and M₈, and R Counter inputs R₄ and R₅ are internally forced low (“0”).

Table 7. Primary Register Programming

*Serial data clocked serially on Sclk rising edge while E_WR “high” and captured in the double buffer on E_WR falling edge.

Figure 5. Parallel Interface Mode Timing Diagram

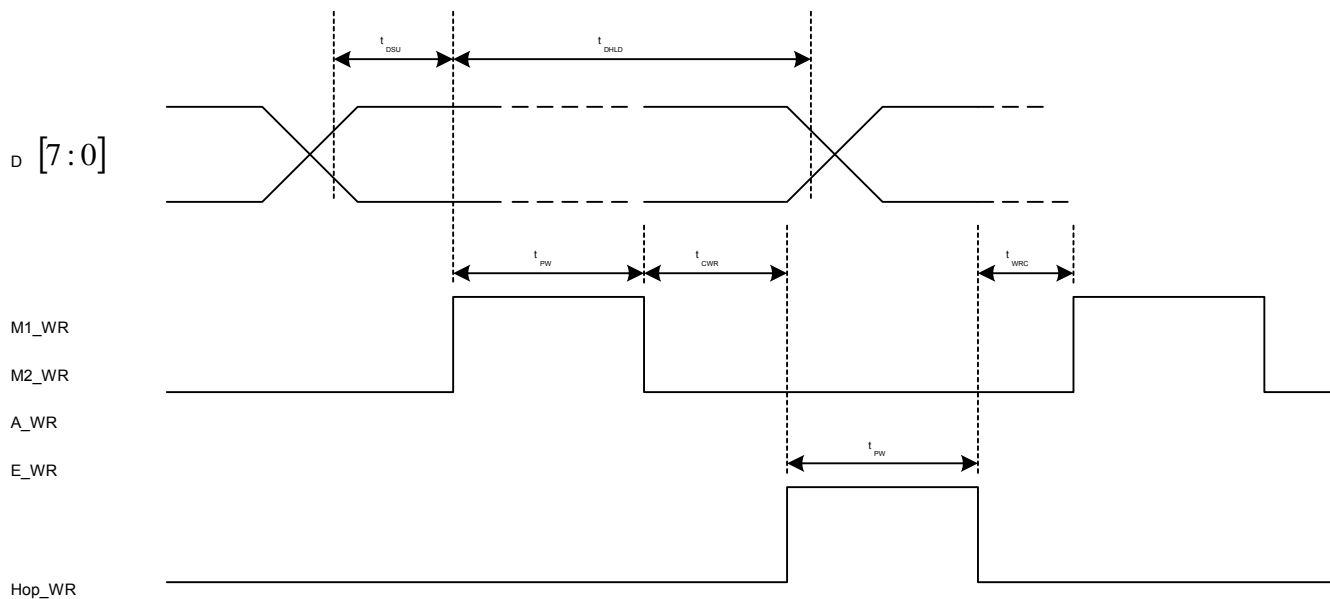

Figure 6. Serial Interface Mode Timing Diagram

Enhancement Register

The functions of the enhancement register bits are shown below with all bits active “high”.

Table 9. Enhancement Register Bit Functionality

Bit Function		Description
Bit 0	Reserved**	
Bit 1	Reserved**	
Bit 2	Reserved**	
Bit 3	Power down	Power down of all functions except programming interface.
Bit 4	Counter load	Immediate and continuous load of counter programming as directed by the $\overline{\text{Bmode}}$ and $\overline{\text{Smode}}$ inputs.
Bit 5	MSEL output	Drives the internal dual modulus prescaler modulus select (MSEL) onto the Dout output.
Bit 6	Prescaler output	Drives the raw internal prescaler output onto the Dout output.
Bit 7	$f_p, f_c \overline{\text{OE}}$	f_p, f_c outputs disabled.

** Program to 0

Phase Detector

The phase detector is triggered by rising edges from the main Counter (f_p) and the reference counter (f_c). It has two outputs, PD_U, and PD_D. If the divided VCO leads the divided reference in phase or frequency (f_p leads f_c), PD_D pulses “low”. If the divided reference leads the divided VCO in phase or frequency (f_c leads f_p), PD_U pulses “low”. The width of either pulse is directly proportional to phase offset between the two input signals, f_p and f_c .

The phase detector gain is equal to $2.7 \text{ V} / 2 \pi$, which numerically yields $0.43 \text{ V} / \text{radian}$.

PD_U and PD_D drive an active loop filter which controls the VCO tune voltage. PD_U pulses result in an increase in VCO frequency; PD_D pulses result in a decrease in VCO frequency (for a positive K_v VCO).

A lock detect output, LD is also provided, via the pin Cext. Cext is the logical “NAND” of PD_U and PD_D waveforms, which is driven through a series $2 \text{ k}\Omega$ resistor. Connecting Cext to an external shunt capacitor provides low pass filtering of this signal. Cext also drives the input of an internal inverting comparator with an open drain output. Thus LD is an “AND” function of PD_U and PD_D.
