

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## LOW SKEW, DUAL, 1-TO-5 DIFFERENTIAL-TO-HSTL FANOUT BUFFER

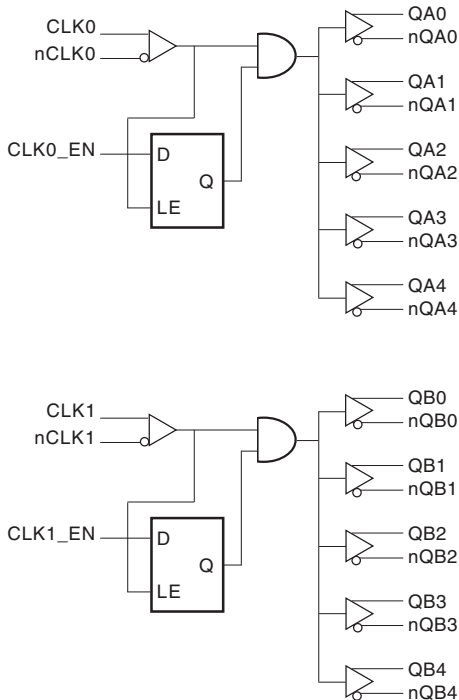

### GENERAL DESCRIPTION

The ICS85210-31 is a low skew, high performance dual 1-to-5 Differential-to-HSTL Fanout Buffer. The CLKx, nCLKx pairs can accept most standard differential input levels. The ICS85210-31 is characterized to operate from a 3.3V power supply. Guaranteed output and part-to-part skew characteristics make the ICS85210-31 ideal for those clock distribution applications demanding well defined performance and repeatability.

### FEATURES

- Dual 1-to-5 HSTL compatible bank outputs
- 2 selectable differential clock input pairs
- CLKx, nCLKx pairs can accept the following differential input levels: LVPECL, LVDS, HSTL, SSTL, HCSL
- Maximum output frequency: 650MHz
- Translates any single ended input signal to LVHSTL levels with resistor bias on nCLKx inputs
- Output skew: 50ps (maximum)
- Part-to-part skew: 350ps (maximum)
- Propagation delay: 2ns (maximum)
- 3.3V core, 1.8V output operating supply
- 0°C to 70°C ambient operating temperature
- Available in both standard (RoHS 5) and lead-free (RoHS 6) packages
- Industrial temperature information available upon request

## APPLICATION INFORMATION

### WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LEVELS

Figure 2 shows how the differential input can be wired to accept single ended levels. The reference voltage  $V_{REF} = V_{DD}/2$  is generated by the bias resistors R1, R2 and C1. This bias circuit should be located as close as possible to the input pin. The ratio

of R1 and R2 might need to be adjusted to position the  $V_{REF}$  in the center of the input voltage swing. For example, if the input clock swing is only 2.5V and  $V_{DD} = 3.3V$ ,  $V_{REF}$  should be 1.25V and  $R2/R1 = 0.609$ .

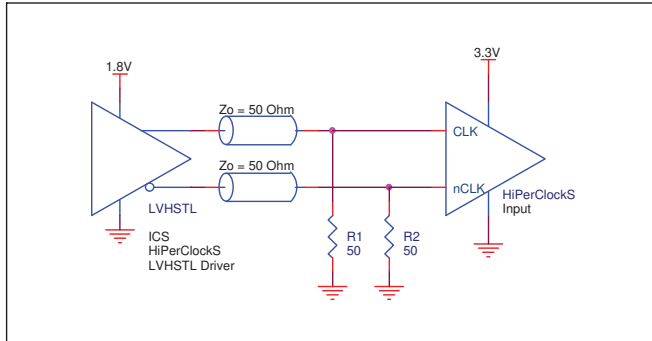

**FIGURE 2. SINGLE ENDED SIGNAL DRIVING DIFFERENTIAL INPUT**

### DIFFERENTIAL CLOCK INPUT INTERFACE

The CLK /nCLK accepts LVDS, LVPECL, HSTL, SSTL, HCSSL and other differential signals. Both  $V_{SWING}$  and  $V_{OH}$  must meet the  $V_{PP}$  and  $V_{CMR}$  input requirements. Figures 3A to 3E show interface examples for the CLK/nCLK input driven by the most common driver types. The input interfaces suggested here

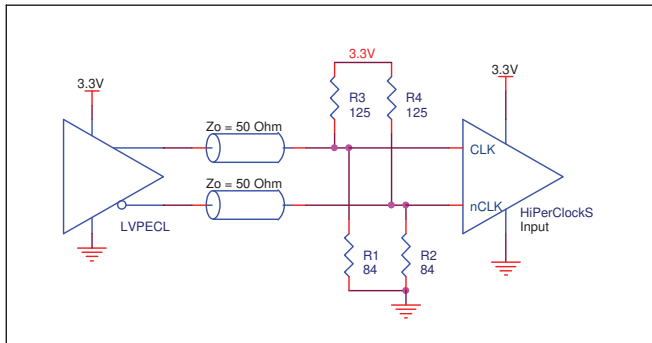

are examples only. Please consult with the vendor of the driver component to confirm the driver termination requirements. For example in *Figure 3A*, the input termination applies for HSTL drivers. If you are using an HSTL driver from another vendor, use their termination recommendation.

## POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the ICS85210-31. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the ICS85210-31 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for  $V_{DD} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

**NOTE:** Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)<sub>MAX</sub> =  $V_{DD\_MAX} * I_{DD\_MAX} = 3.465V * 120mA = 416mW$
- Power (outputs)<sub>MAX</sub> = **32.8mW/Loaded Output pair**  
 If all outputs are loaded, the total power is  $10 * 32.8mW = 328mW$

**Total Power**<sub>MAX</sub> (3.465V, with all outputs switching) =  $416mW + 328mW = 744mW$

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for the devices is 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd\_total + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd\_total$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming a moderate air flow of 200 linear feet per minute and a multi-layer board, the appropriate value is 42.1°C/W per Table 6 below. Therefore,  $T_j$  for an ambient temperature of 70°C with all outputs switching is:

$70^\circ C + 0.744W * 42.1^\circ C/W = 101^\circ C$ . This is well below the limit of 125°C.

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

**TABLE 6. THERMAL RESISTANCE  $\theta_{JA}$  FOR 32-PIN LQFP, FORCED CONVECTION**

<b><math>\theta_{JA}</math> by Velocity (Linear Feet per Minute)</b>			
	<b>0</b>	<b>200</b>	<b>500</b>
Single-Layer PCB, JEDEC Standard Test Boards	67.8°C/W	55.9°C/W	50.1°C/W
Multi-Layer PCB, JEDEC Standard Test Boards	47.9°C/W	42.1°C/W	39.4°C/W

**NOTE:** Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs.

3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

HSTL output driver circuit and termination are shown in *Figure 4*.

**FIGURE 4. HSTL DRIVER CIRCUIT AND TERMINATION**

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load.

Pd\_H is power dissipation when the output drives high.

Pd\_L is the power dissipation when the output drives low.

$$Pd\_H = (V_{OH\_MIN} / R_L) * (V_{DDO\_MAX} - V_{OH\_MIN})$$

$$Pd\_L = (V_{OL\_MAX} / R_L) * (V_{DDO\_MAX} - V_{OL\_MAX})$$

$$Pd\_H = (1V/50\Omega) * (2V - 1V) = \mathbf{20mW}$$

$$Pd\_L = (0.4V/50\Omega) * (2V - 0.4V) = \mathbf{12.8mW}$$

$$\text{Total Power Dissipation per output pair} = Pd\_H + Pd\_L = \mathbf{32.8mW}$$
