

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

### GENERAL DESCRIPTION

The 85222-01 is a Dual LVCMOS / LVTTTL-to-Differential HSTL translator. The 85222-01 has two single ended clock inputs. The single ended clock input accepts LVCMOS or LVTTTL input levels and translates them to HSTL levels. The small outline 8-pin SOIC package makes this device ideal for applications where space, high performance and low power are important.

### FEATURES

- Two differential HSTL outputs
- CLK0, CLK1 LVCMOS/LVTTTL clock inputs
- CLK0 and CLK1 can accept the following input levels: LVCMOS or LVTTTL
- Maximum output frequency: 350MHz
- Part-to-part skew: 375ps (maximum)
- Propagation delay: 1075ps (maximum)
- $V_{OH}$ : 1.4V (maximum)
- Full 3.3V and 2.5V operating supply voltage
- 0°C to 70°C ambient operating temperature
- Industrial temperature information available upon request
- Available in lead-free RoHS-compliant package

TABLE 1. PIN DESCRIPTIONS

Number	Name	Type		Description
1, 2	Q0, nQ0	Output		Differential output pair. HSTL interface levels.
3, 4	Q1, nQ1	Output		Differential output pair. HSTL interface levels.
5	GND	Power		Power supply ground.
6	CLK1	Input	Pullup	LVC MOS / LV TTL clock input.
7	CLK0	Input	Pullup	LVC MOS / LV TTL clock input.
8	V <sub>DD</sub>	Power		Positive supply pin.

NOTE: *Pullup* refers to internal input resistors. See Table 2, Pin Characteristics, for typical values.

NOTE: Unused output pairs must be terminated.

TABLE 2. PIN CHARACTERISTICS

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
C <sub>IN</sub>	Input Capacitance			4		pF
R <sub>PULLUP</sub>	Input Pullup Resistor			51		kΩ
R <sub>PULLDOWN</sub>	Input Pulldown Resistor			51		kΩ

**ABSOLUTE MAXIMUM RATINGS**

Supply Voltage, $V_{DD}$	4.6V
Inputs, $V_I$	-0.5V to $V_{DD} + 0.5V$
Outputs, $I_O$	
Continuous Current	50mA
Surge Current	100mA
Package Thermal Impedance, $\theta_{JA}$	112.7°C/W (0 lfpm)
Storage Temperature, $T_{STG}$	-65°C to 150°C

NOTE: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

## APPLICATION INFORMATION

### WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LEVELS

Figure 1 shows how the differential input can be wired to accept single ended levels. The reference voltage  $V_{REF} = V_{DD}/2$  is generated by the bias resistors R1, R2 and C1. This bias circuit should be located as close as possible to the input pin. The ratio

of R1 and R2 might need to be adjusted to position the  $V_{REF}$  in the center of the input voltage swing. For example, if the input clock swing is only 2.5V and  $V_{CC} = 3.3V$ ,  $V_{REF}$  should be 1.25V and  $R2/R1 = 0.609$ .

FIGURE 1. SINGLE ENDED SIGNAL DRIVING DIFFERENTIAL INPUT

### RECOMMENDATIONS FOR UNUSED INPUT AND OUTPUT PINS

#### INPUTS:

##### CLK INPUT:

For applications not requiring the use of a clock input, it can be left floating. Though not required, but for additional protection, a 1k $\Omega$  resistor can be tied from the CLK input to ground.

#### OUTPUTS:

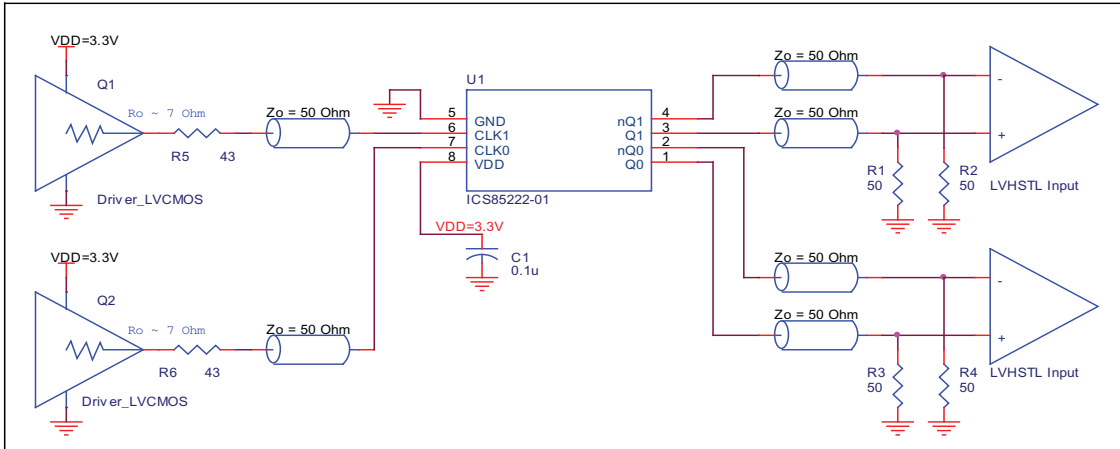

##### HSTL OUTPUT

All unused LVHSTL outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

**SCHEMATIC EXAMPLE**

Figure 2 shows a schematic example of 85222-01. In this example, the inputs are driven by 7Ω output LVC MOS drivers with series terminations. The decoupling capacitors should be

physically located near the power pin. For 85222-01, the unused output need to be terminated.

**FIGURE 2. 85222-01 HSTL BUFFER SCHEMATIC EXAMPLE**

## POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the 85222-01. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the 85222-01 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for  $V_{DD} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

**NOTE:** Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)<sub>MAX</sub> =  $V_{DD\_MAX} * I_{DD\_MAX} = 3.465V * 35mA = 121.3mW$
- Power (outputs)<sub>MAX</sub> = **82.34mW/Loaded Output pair**  
If all outputs are loaded, the total power is  $2 * 82.34mW = 164.68mW$

**Total Power**<sub>MAX</sub> (3.465V, with all outputs switching) =  $121.3mW + 164.68mW = 285.98mW$

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for the devices is 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd\_total + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd\_total$  = Total device power dissipation (example calculation is in Section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming a moderate air flow of 200 linear feet per minute and a multi-layer board, the appropriate value is 103.3°C/W per Table 5 below. Therefore,  $T_j$  for an ambient temperature of 70°C with all outputs switching is:

$70^\circ C + 0.286W * 103.3^\circ C/W = 99.5^\circ C$ . This is well below the limit of 125°C.

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

**TABLE 5. THERMAL RESISTANCE  $\theta_{JA}$  FOR 8-PIN SOIC, FORCED CONVECTION**

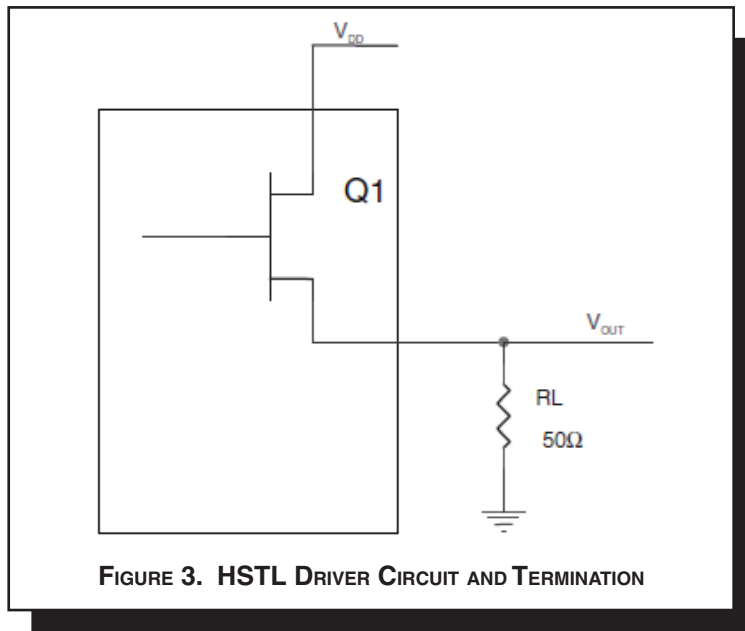

$\theta_{JA}$ by Velocity (Linear Feet per Minute)			
	0	200	500
Single-Layer PCB, JEDEC Standard Test Boards	153.3°C/W	128.5°C/W	115.5°C/W
Multi-Layer PCB, JEDEC Standard Test Boards	112.7°C/W	103.3°C/W	97.1°C/W

**NOTE:** Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs.

3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

HSTL output driver circuit and termination are shown in *Figure 3*.

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load.

Pd\_H is power dissipation when the output drives high.  
 Pd\_L is the power dissipation when the output drives low.

$$Pd\_H = (V_{OH\_MAX} / R_L) * (V_{DD\_MAX} - V_{OH\_MAX})$$

$$Pd\_L = (V_{OL\_MAX} / R_L) * (V_{DD\_MAX} - V_{OL\_MAX})$$

$$Pd\_H = (1.4V / 50\Omega) * (3.465V - 1.4V) = \mathbf{57.82mW}$$

$$Pd\_L = (0.4V / 50\Omega) * (3.465V - 0.4V) = \mathbf{24.52mW}$$

$$\text{Total Power Dissipation per output pair} = Pd\_H + Pd\_L = \mathbf{82.34mW}$$

## RELIABILITY INFORMATION
