Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

1-to-2, LVCMOS/LVTTL-to-Differential HSTL Translator
85222-02

GENERAL DESCRIPTION

The 85222-02 is a 1-to-2 LVCMOS / LVTTL-to-Differential HSTL translator. The 85222-02 has one single ended clock input. The single-ended clock input accepts LVCMOS or LVTTL input levels and translates them to HSTL levels. The small outline 8-pin SOIC package makes this device ideal for applications where space, high performance and low power are important.

FEATURES

- Two differential HSTL outputs

- One LVCMOS/LVTTL clock input

- CLK input can accept the following input levels: LVCMOS or LVTTL

- Maximum output frequency: 350MHz

- Part-to-part skew: 250ps (maximum)

- Propagation delay: 1.25ns (maximum)

- V_{OH}: 1.4V (maximum)

- Output crossover voltage: 0.68V - 0.9V

- Full 3.3V operating supply voltage

- 0°C to 70°C ambient operating temperature

- Industrial temperature information available upon request

- Available in lead-free RoHS compliant package

SCHEMATIC EXAMPLE

Figure 2 shows a schematic example of 85222-02. In the example, the input is driven by a 7 ohm LVCMOS driver with a series termination. The decoupling capacitor should be physically located near the power pin. For 85222-02, the unused output need to be terminated.

POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the 85222-02.
Equations and example calculations are also provided.

1. Power Dissipation.
The total power dissipation for the 85222-02 is the sum of the core power plus the power dissipated in the load(s).
The following is the power dissipation for V_{DD} = 3.3V + 5% = 3.465V, which gives worst case results.
NOTE: Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)$_{MAX}$ = V_{DD_MAX} * I_{DD_MAX} = 3.465V * 50mA = **173.25mW**
- Power (outputs)$_{MAX}$ = **73.8mW/Loaded Output pair**
  If all outputs are loaded, the total power is 2 * 82.3mW = **164.6mW**

  Total Power $_{\_MAX}$ (3.465V, with all outputs switching) = 173.25mW + 164.6mW = **337.86mW**

2. Junction Temperature.
Junction temperature, Tj, is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS™ devices is 125°C.

The equation for Tj is as follows: $Tj = \theta_{JA} * Pd\_total + T_A$

Tj = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_total = Total device power dissipation (example calculation is in Section 1 above)
T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming a moderate air flow of 200 linear feet per minute and a multi-layer board, the appropriate value is 103.3°C/W per Table 5 below. Therefore, Tj for an ambient temperature of 70°C with all outputs switching is:

70°C + 0.337W * 103.3°C/W = 104.8°C. This is below the limit of 125°C.

This calculation is only an example. Tj will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

TABLE 5. THERMAL RESISTANCE θ_{JA} FOR 8-PIN SOIC, FORCED CONVECTION

θ_{JA} by Velocity (Linear Feet per Minute)			
	0	200	500
Single-Layer PCB, JEDEC Standard Test Boards	153.3°C/W	128.5°C/W	115.5°C/W
Multi-Layer PCB, JEDEC Standard Test Boards	112.7°C/W	103.3°C/W	97.1°C/W

NOTE: Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs.

3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

HSTL output driver circuit and termination are shown in *Figure 1.*

FIGURE 1. HSTL DRIVER CIRCUIT AND TERMINATION

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load.

Pd_H is power dissipation when the output drives high.
Pd_L is the power dissipation when the output drives low.

$$Pd\_H = (V_{OH\_MAX}/R_L) * (V_{DD\_MAX} - V_{OH\_MAX})$$

$$Pd\_L = (V_{OL\_MAX}/R_L) * (V_{DD\_MAX} - V_{OL\_MAX})$$

Pd_H = (1.4V/50Ω) * (3.465V - 1.4V) = **57.8mW**
Pd_L = (0.4V/50Ω) * (3.465V - 0.4V) = **24.52mW**

Total Power Dissipation per output pair = Pd_H + Pd_L = **82.3mW**
