### General Description

The 932SQL420 is a low power version of the CK420BQ synthesizer for Intel-based server platforms. The 932SQL420 is driven with a 25MHz crystal for maximum performance. It generates CPU outputs of 100Mhz. This device has a "low-drift" non-spread SAS/SRC PLL for use in systems that need to communicate across PCIe domains.

### Recommended Application

Low Power CK420BQ

### Key Specifications

- CPU, SRC, NS\_SRC and NS\_SAS cycle-cycle jitter <50ps
- Output to output skew <50ps
- Phase jitter: PCIe Gen2 <2.7ps rms
- Phase jitter: QPI <0.3ps rms

## Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 932SQL420. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

<sup>2</sup> Measured from differential waveform

<sup>3</sup> Slew rate is measured through the Vswing voltage range centered around differential 0V. This results in a +/-150mV window around differential 0V.

<sup>4</sup> Matching applies to rising edge rate for Clock and falling edge rate for Clock#. It is measured using a +/-75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.

<sup>5</sup> Vcross is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock# falling).

<sup>6</sup> The total variation of all Vcross measurements in any particular system. Note that this is a subset of V\_cross\_min/max (V\_cross absolute) allowed. The intent is to limit Vcross induced modulation by setting V\_cross\_delta to be smaller than

<sup>7</sup> Includes overshoot and undershoot.

<sup>8</sup> Measured from single-ended waveform

<sup>9</sup> Measured with scope averaging off, using statistics function. Variation is difference between min and max.
