Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

DATASHEET

Four Output Differential Buffer for PCI Express

9DB401C

Description

The 9DB401C is a DB400 Version 2.0 Yellow Cover part with PCI Express support. It can be used in PC or embedded systems to provide outputs that have low cycle-to-cycle jitter (50ps), low output-to-output skew (100ps), and are PCI Express gen 1 compliant. The 9DB401C supports a 1 to 4 output configuration, taking a spread or non spread differential HCSL input from a CK410(B) main clock such as 954101 and 932S401, or any other differential HCSL pair. 9DB401C can generate HCSL or LVDS outputs from 50 to 200MHz in PLL mode or 0 to 400Mhz in bypass mode. There are two de-jittering modes available selectable through the HIGH_BW# input pin, high bandwidth mode provides de-jittering for spread inputs and low bandwidth mode provides extra de-jittering for non-spread inputs. The SRC_STOP#, PD#, and OE real-time input pins provide completely programmable power management control.

Output Features

- 4 - 0.7V HCSL or LVDS differential output pairs
- Supports zero delay buffer mode and fanout mode
- Bandwidth programming available

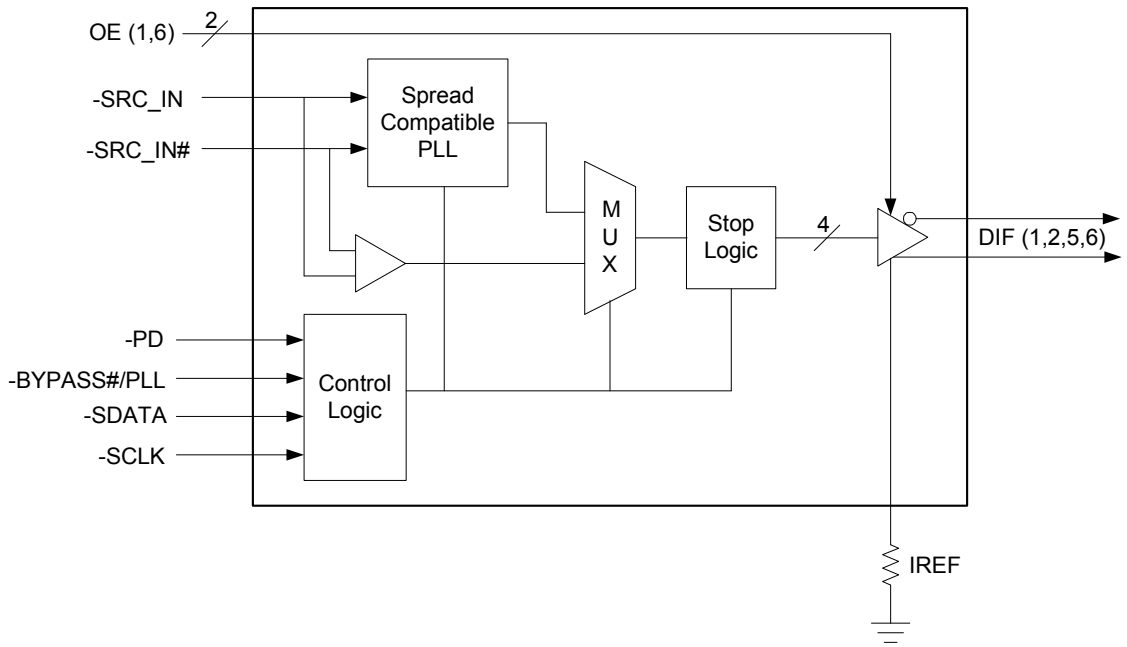
Features/Benefits

- Spread spectrum modulation tolerant, 0 to -0.5% down spread and +/- 0.25% center spread
- Supports undriven differential outputs in PD# and SRC_STOP# modes for power management.

Key Specifications

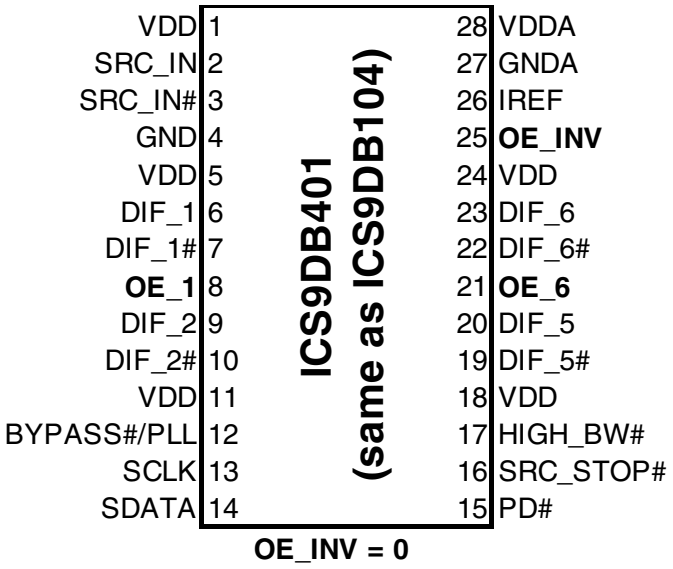
- Outputs cycle-cycle jitter: < 50ps
- Outputs skew: < 50ps
- Extended frequency range in bypass mode:
  Revision B: up to 333.33MHz
  Revision C: up to 400MHz
- Real-time PLL lock detect output pin
- 28-pin SSOP/TSSOP package
- Available in RoHS compliant packaging

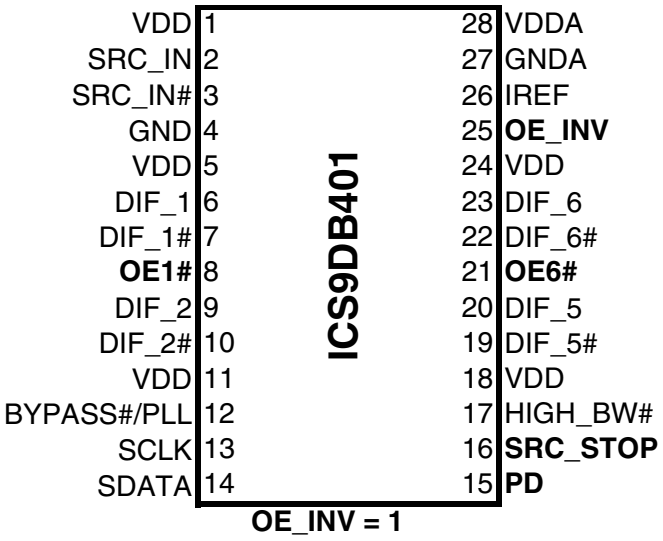
Functional Block Diagram



Note: Polarities shown for OE_INV = 0.

Pin Configuration





28-pin SSOP & TSSOP

Polarity Inversion Pin List Table

Pins	OE_INV	
	0	1
8	OE_1	OE1#
15	PD#	PD
16	DIF_STOP#	DIF_STOP
21	OE_6	OE6#

Power Groups

Pin Number		Description
VDD	**GND**	
1	4	SRC_IN/SRC_IN#
5,11,18, 24	4	DIF(1,2,5,6)
N/A	27	IREF
28	27	Analog VDD & GND for PLL core

Pin Description for OE_INV = 0

PIN #	PIN NAME	PIN TYPE	DESCRIPTION
1	VDD	PWR	Power supply, nominal 3.3V
2	SRC_IN	IN	0.7 V Differential SRC TRUE input
3	SRC_IN#	IN	0.7 V Differential SRC COMPLEMENTARY input
4	GND	PWR	Ground pin.
5	VDD	PWR	Power supply, nominal 3.3V
6	DIF_1	OUT	0.7V differential true clock output
7	DIF_1#	OUT	0.7V differential complement clock output
8	OE_1	IN	Active high input for enabling output 1. 0 = tri-state outputs, 1= enable outputs
9	DIF_2	OUT	0.7V differential true clock output
10	DIF_2#	OUT	0.7V differential complement clock output
11	VDD	PWR	Power supply, nominal 3.3V
12	BYPASS#/PLL	IN	Input to select Bypass(fan-out) or PLL (ZDB) mode 0 = Bypass mode, 1= PLL mode
13	SCLK	IN	Clock pin of SMBus circuitry, 5V tolerant.
14	SDATA	I/O	Data pin for SMBus circuitry, 5V tolerant.
15	PD#	IN	Asynchronous active low input pin used to power down the device. The internal clocks are disabled and the VCO and the crystal are stopped.
16	SRC_STOP#	IN	Active low input to stop SRC outputs.
17	HIGH_BW#	IN	3.3V input for selecting PLL Band Width 0 = High, 1= Low
18	VDD	PWR	Power supply, nominal 3.3V
19	DIF_5#	OUT	0.7V differential complement clock output
20	DIF_5	OUT	0.7V differential true clock output
21	OE_6	IN	Active high input for enabling output 6. 0 = tri-state outputs, 1= enable outputs
22	DIF_6#	OUT	0.7V differential complement clock output
23	DIF_6	OUT	0.7V differential true clock output
24	VDD	PWR	Power supply, nominal 3.3V
25	OE_INV	IN	This latched input selects the polarity of the OE pins. 0 = OE pins active high, 1 = OE pins active low (OE#)
26	IREF	OUT	This pin establishes the reference current for the differential current-mode output pairs. This pin requires a fixed precision resistor tied to ground in order to establish the appropriate current. 475 ohms is the standard value.
27	GNDA	PWR	Ground pin for the PLL core.
28	VDDA	PWR	3.3V power for the PLL core.

Pin Description for OE_INV = 1

PIN #	PIN NAME	PIN TYPE	DESCRIPTION
1	VDD	PWR	Power supply, nominal 3.3V
2	SRC_IN	IN	0.7 V Differential SRC TRUE input
3	SRC_IN#	IN	0.7 V Differential SRC COMPLEMENTARY input
4	GND	PWR	Ground pin.
5	VDD	PWR	Power supply, nominal 3.3V
6	DIF_1	OUT	0.7V differential true clock output
7	DIF_1#	OUT	0.7V differential complement clock output
8	OE1#	IN	Active low input for enabling DIF pair 1. 1 = tri-state outputs, 0 = enable outputs
9	DIF_2	OUT	0.7V differential true clock output
10	DIF_2#	OUT	0.7V differential complement clock output
11	VDD	PWR	Power supply, nominal 3.3V
12	BYPASS#/PLL	IN	Input to select Bypass(fan-out) or PLL (ZDB) mode 0 = Bypass mode, 1= PLL mode
13	SCLK	IN	Clock pin of SMBus circuitry, 5V tolerant.
14	SDATA	I/O	Data pin for SMBus circuitry, 5V tolerant.
15	PD	IN	Asynchronous active high input pin used to power down the device. The internal clocks are disabled and the VCO is stopped.
16	SRC_STOP	IN	Active high input to stop SRC outputs.
17	HIGH_BW#	IN	3.3V input for selecting PLL Band Width 0 = High, 1= Low
18	VDD	PWR	Power supply, nominal 3.3V
19	DIF_5#	OUT	0.7V differential complement clock output
20	DIF_5	OUT	0.7V differential true clock output
21	OE6#	IN	Active low input for enabling DIF pair 6. 1 = tri-state outputs, 0 = enable outputs
22	DIF_6#	OUT	0.7V differential complement clock output
23	DIF_6	OUT	0.7V differential true clock output
24	VDD	PWR	Power supply, nominal 3.3V
25	OE_INV	IN	This latched input selects the polarity of the OE pins. 0 = OE pins active high, 1 = OE pins active low (OE#)
26	IREF	OUT	This pin establishes the reference current for the differential current-mode output pairs. This pin requires a fixed precision resistor tied to ground in order to establish the appropriate current. 475 ohms is the standard value.
27	GNDA	PWR	Ground pin for the PLL core.
28	VDDA	PWR	3.3V power for the PLL core.

General SMBus serial interface information for the 9DB401C

How to Write:

- Controller (host) sends a start bit.
- Controller (host) sends the write address DC (h)
- IDT clock will ***acknowledge***
- Controller (host) sends the begining byte location = N
- IDT clock will ***acknowledge***
- Controller (host) sends the data byte count = X
- IDT clock will ***acknowledge***
- Controller (host) starts sending ***Byte N through Byte N + X -1***
- IDT clock will ***acknowledge*** each byte ***one at a time***
- Controller (host) sends a Stop bit

How to Read:

- Controller (host) will send start bit.
- Controller (host) sends the write address DC (h)
- IDT clock will ***acknowledge***
- Controller (host) sends the begining byte location = N
- IDT clock will ***acknowledge***
- Controller (host) will send a separate start bit.
- Controller (host) sends the read address DD (h)
- IDT clock will ***acknowledge***
- IDT clock will send the data byte count = X
- IDT clock sends ***Byte N + X -1***
- IDT clock sends ***Byte 0 through byte X (if $X_{(h)}$ was written to byte 8)***.
- Controller (host) will need to acknowledge each byte
- Controllor (host) will send a not acknowledge bit
- Controller (host) will send a stop bit

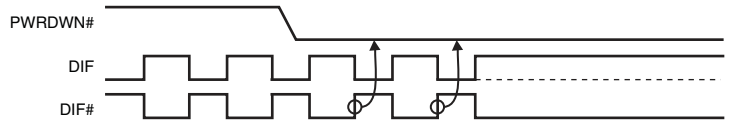
Bit 0	-	BC0		RW	-	-	1

PD#

The PD# pin cleanly shuts off all clocks and places the device into a power saving mode. PD# must be asserted before shutting off the input clock or power to insure an orderly shutdown. PD is asynchronous active-low input for both powering down the device and powering up the device. When PD# is asserted, all clocks will be driven high, or tri-stated (depending on the PD# drive mode and Output control bits) before the PLL is shut down.

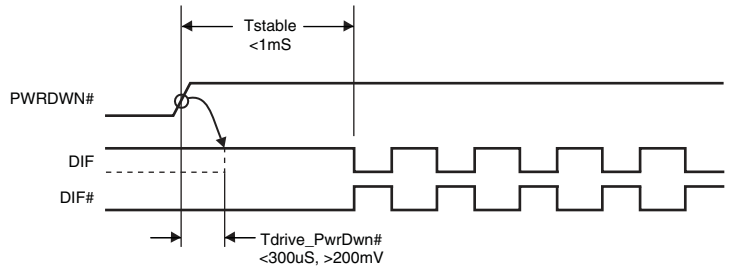
PD# Assertion

When PD# is sampled low by two consecutive rising edges of DIF#, all DIF outputs must be held High, or tri-stated (depending on the PD# drive mode and Output control bits) on the next High-Low transition of the DIF# outputs. When the PD# drive mode bit is set to '0', all clock outputs will be held with DIF driven High with 2 x I_{REF} and DIF# tri-stated. If the PD# drive mode bit is set to '1', both DIF and DIF# are tri-stated.



PD# De-assertion

Power-up latency is less than 1 ms. This is the time from de-assertion of the PD# pin, or VDD reaching 3.3V, or the time from valid SRC_IN clocks until the time that stable clocks are output from the device (PLL Locked). If the PD# drive mode bit is set to '1', all the DIF outputs must driven to a voltage of >200 mV within 300 ms of PD# de-assertion.



Note: Polarities in timing diagrams are shown OE_INV = 0. They are similar to OE_INV = 1.

SRC_STOP#

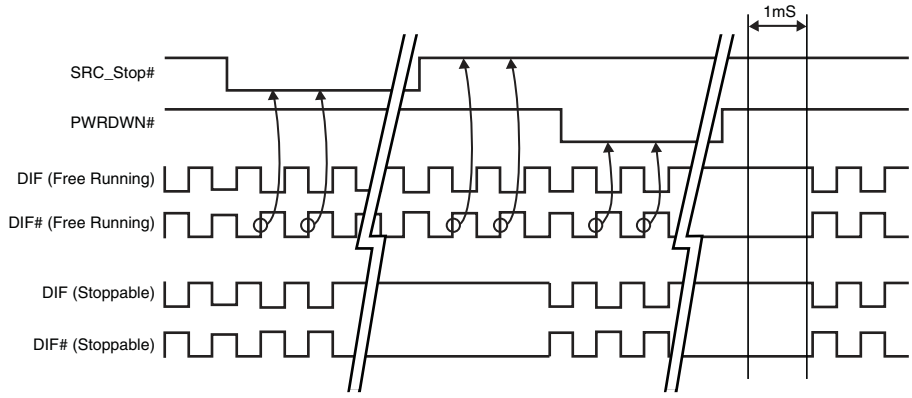
The SRC_STOP# signal is an active-low asynchronous input that cleanly stops and starts the DIF outputs. A valid clock must be present on SRC_IN for this input to work properly. The SRC_STOP# signal is de-bounced and must remain stable for two consecutive rising edges of DIF# to be recognized as a valid assertion or de-assertion.

SRC_STOP# - Assertion (transition from '1' to '0')

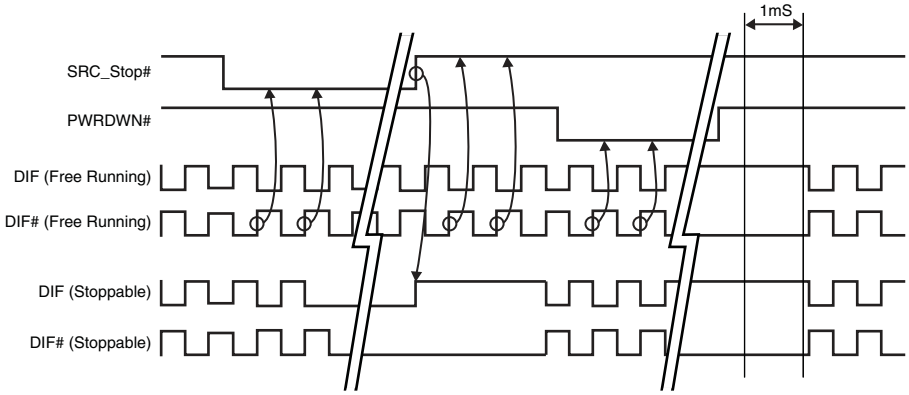
Asserting SRC_STOP# causes all DIF outputs to stop after their next transition (if the control register settings allow the output to stop). When the SRC_STOP# drive bit is '0', the final state of all stopped DIF outputs is DIF = High and DIF# = Low. There is no change in output drive current. DIF is driven with $6xI_{REF}$. DIF# is not driven, but pulled low by the termination. When the SRC_STOP# drive bit is '1', the final state of all DIF output pins is Low. Both DIF and DIF# are not driven.

All stopped differential outputs resume normal operation in a glitch-free manner. The de-assertion latency to active outputs is 2-6 DIF clock periods, with all DIF outputs resuming simultaneously. If the SRC_STOP# drive control bit is '1' (tri-state), all stopped DIF outputs must be driven High (>200 mV) within 10 ns of de-assertion.

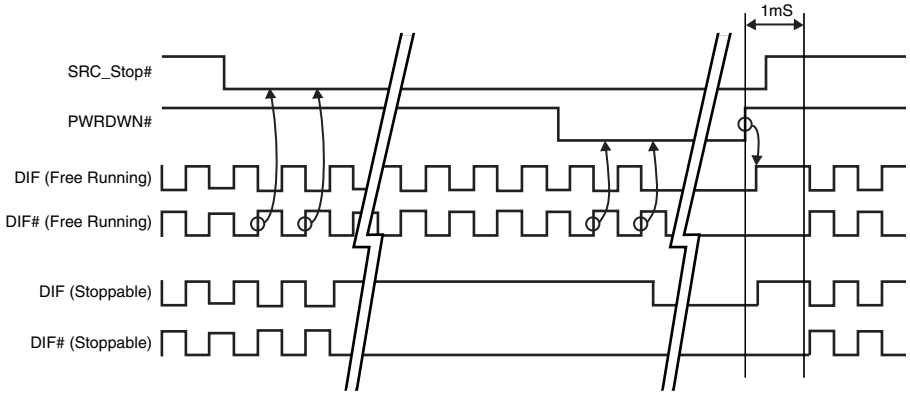
SRC_STOP_1 (SRC_Stop = Driven, PD = Driven)



SRC_STOP_2 (SRC_Stop =Tristate, PD = Driven)



SRC_STOP_3 (SRC_Stop = Driven, PD = Tristate)



SRC_STOP_4 (SRC_Stop = Tristate, PD = Tristate)

Ordering Information

Part / Order Number	Shipping Packaging	Package	Temperature
9DB401CGLF	Tubes	28-pin TSSOP	0 to +70°C
9DB401CGLFT	Tape and Reel	28-pin TSSOP	0 to +70°C
9DB401CFLF	Tubes	28-pin SSOP	0 to +70°C
9DB401CFLFT	Tape and Reel	28-pin SSOP	0 to +70°C

"LF" denotes Pb Configuration, RoHS compliant.
"C" is the device revision designator (will not correlate to the datasheet revision)

Revision History

Rev.	Issue Date	Description	Page #
0.1	4/21/2005	Changed Ordering Information from"LN" to "LF".	14,15
A	8/15/2005	1. Updated LF Ordering Information to RoHS Compliant. 2. Release to web.	14-15
B	9/7/2006	Updated Electrical Characteristics.	Various
C	5/22/2007	Updated Polarity Inversion Table.	2
D	2/28/2008	Added Input Clock Specs	6
E	3/18/2008	Fixed typo in clock Input Parameters	6
F	9/5/2008	1. Updated Electrical Characteristics to add propagation delay and phase noise information. 2. Added SMBus electrical characteristics 3. Added foot note about DIF input running in order for the SMBus interface to work 4. Added foot note to Byte 1 about functionality of OE bits and OE pins. 5. Updated Block Diagram to correctly indicate the OE pins.	Various
G	11/18/2010	Updated Block Diagram	1
H	1/27/2011	Updated Termination Figure 4	8
