Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

EIGHT OUTPUT DIFFERENTIAL BUFFER FOR PCIE GEN1, GEN2 AND QPI

ICS9DB823B

General Description

The ICS9DB823B is compatible with the Intel DB800Q Differential Buffer Specification. This buffer provides 8 PCI-Express SRC or 8 QPI clocks. The ICS9DB823B is driven by a differential output pair from a CK410B+ or CK509B main clock generator.

Recommended Application

DB800Q compatible part with PCIe Gen1, Gen 2 and QPI support

Output Features

- 8 - 0.7V current-mode differential output pairs
- Supports zero delay buffer mode and fanout mode
- Bandwidth programming available
- 50-133 MHz operation in PLL mode
- 33-400 MHz operation in Bypass mode

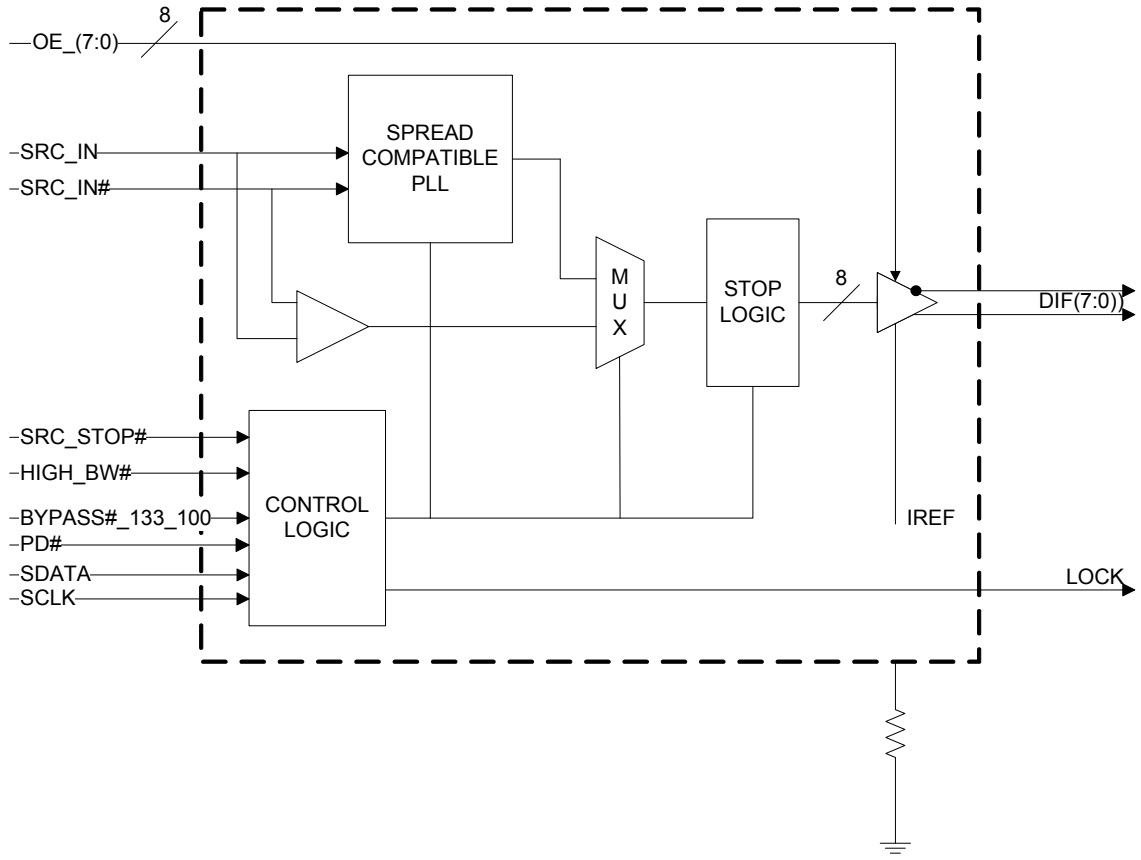
Features/Benefits

- Spread spectrum modulation tolerant, 0 to -0.5% down spread and +/- 0.25% center spread
- Supports undriven differential outputs in Power Down and DIF_STOP# modes for power management.

Key Specifications

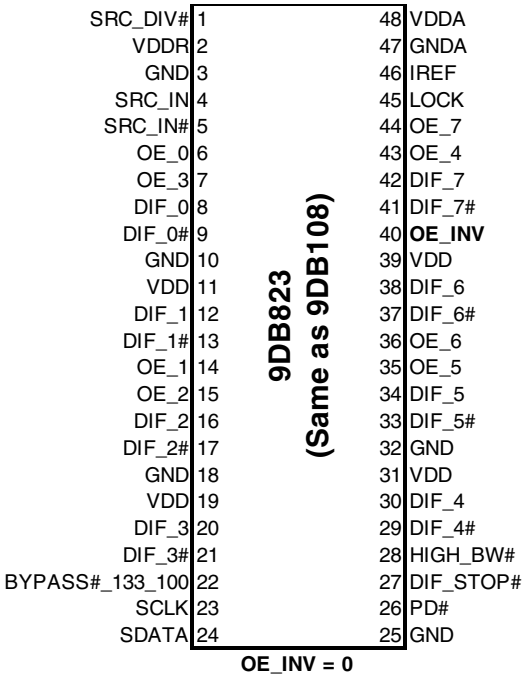
- Outputs cycle-cycle jitter < 50ps
- Output to Output skew <50ps
- Phase jitter: PCIe Gen1 < 86ps peak to peak
- Phase jitter: PCIe Gen2 < 3.0/3.1ps rms
- Phase jitter: QPI < 0.5ps rms

Functional Block Diagram

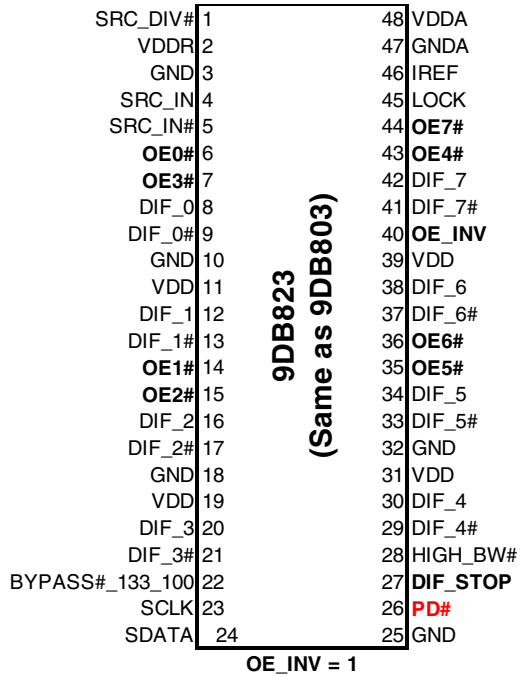


Note: Polarities shown are for OE_INV=0.

Pin Configuration



OE_INV = 0



OE_INV = 1

Note: Pin 26 is always active low. This is different than 9DB803.

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the ICS9DB823B. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

How to Read

- Controller (host) will send a start bit
- Controller (host) sends the write address
- IDT clock will **acknowledge**
- Controller (host) sends the beginning byte location = N
- IDT clock will **acknowledge**
- Controller (host) will send a separate start bit
- Controller (host) sends the read address
- IDT clock will **acknowledge**
- IDT clock will send the data byte count = X
- IDT clock sends Byte **N+X-1**
- IDT clock sends **Byte 0 through Byte X (if $X_{(H)}$ was written to Byte 8)**
- Controller (host) will need to acknowledge each byte
- Controller (host) will send a not acknowledge bit
- Controller (host) will send a stop bit

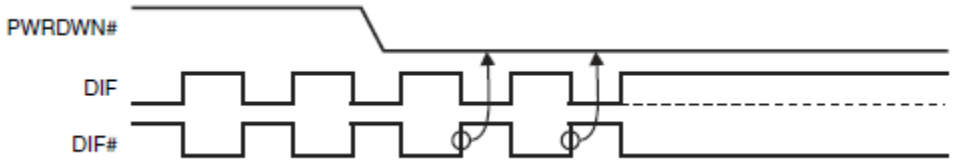
PD#, Power Down

The PD# pin cleanly shuts off all clocks and places the device into a power saving mode. PD# must be asserted before shutting off the input clock or power to insure an orderly shutdown. PD is asynchronous active-low input for both powering down the device and powering up the device. When PD# is asserted, all clocks will be driven high, or tri-stated (depending on the PD# drive mode and Output control bits) before the PLL is shut down.

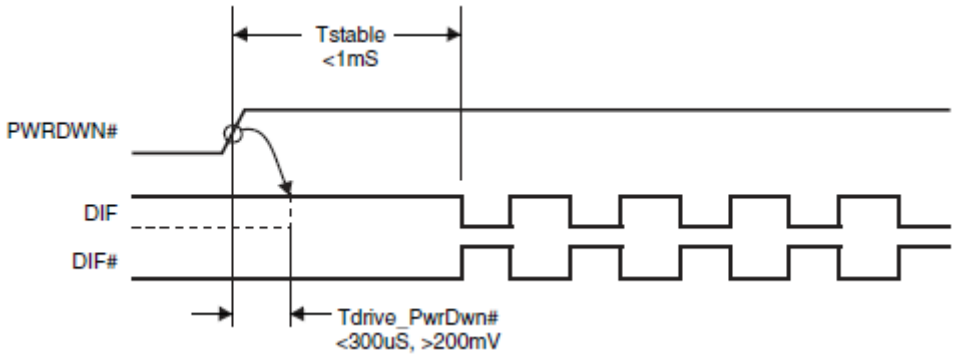
PD# Assertion

When PD# is sampled low by two consecutive rising edges of DIF#, all DIF outputs must be held High, or tri-stated (depending on the PD# drive mode and Output control bits) on the next High-Low transition of the DIF# outputs. When the PD# drive mode bit is set to '0', all clock outputs will be held with DIF driven High with 2 x IREF and DIF# tri-stated. If the PD# drive mode bit is set to '1', both DIF and DIF# are tri-stated.



PD# De-assertion

Power-up latency is less than 1 ms. This is the time from de-assertion of the PD# pin, or VDD reaching 3.3V, or the time from valid SRC_IN clocks until the time that stable clocks are output from the device (PLL Locked). If the PD# drive mode bit is set to '1', all the DIF outputs must driven to a voltage of >200 mV within 300 us of PD# de-assertion.



DIF_STOP#

The DIF_STOP# signal is an active-low asynchronous input that cleanly stops and starts the DIF outputs. A valid clock must be present on SRC_IN for this input to work properly. The DIF_STOP# signal is de-bounced and must remain stable for two consecutive rising edges of DIF# to be recognized as a valid assertion or de-assertion.

DIF_STOP# - Assertion

Asserting DIF_STOP# causes all DIF outputs to stop after their next transition (if the control register settings allow the output to stop). When the DIF_STOP# drive bit is '0', the final state of all stopped DIF outputs is DIF = High and DIF# = Low. There is no change in output drive current. DIF is driven with 6xIREF. DIF# is not driven, but pulled low by the termination. When the DIF_STOP# drive bit is '1', the final state of all DIF output pins is Low. Both DIF and DIF# are not driven.

DIF_STOP# - De-assertion (transition from '0' to '1')

All stopped differential outputs resume normal operation in a glitch-free manner. The de-assertion latency to active outputs is 2-6 DIF clock periods, with all DIF outputs resuming simultaneously. If the DIF_STOP# drive control bit is '1' (tri-state), all stopped DIF outputs must be driven High (>200 mV) within 10 ns of de-assertion.

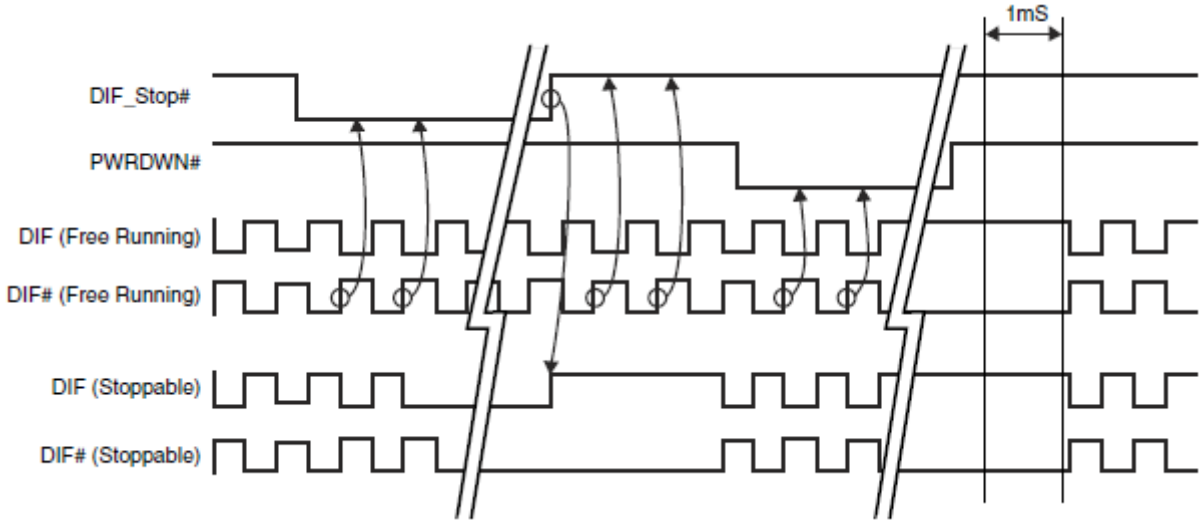
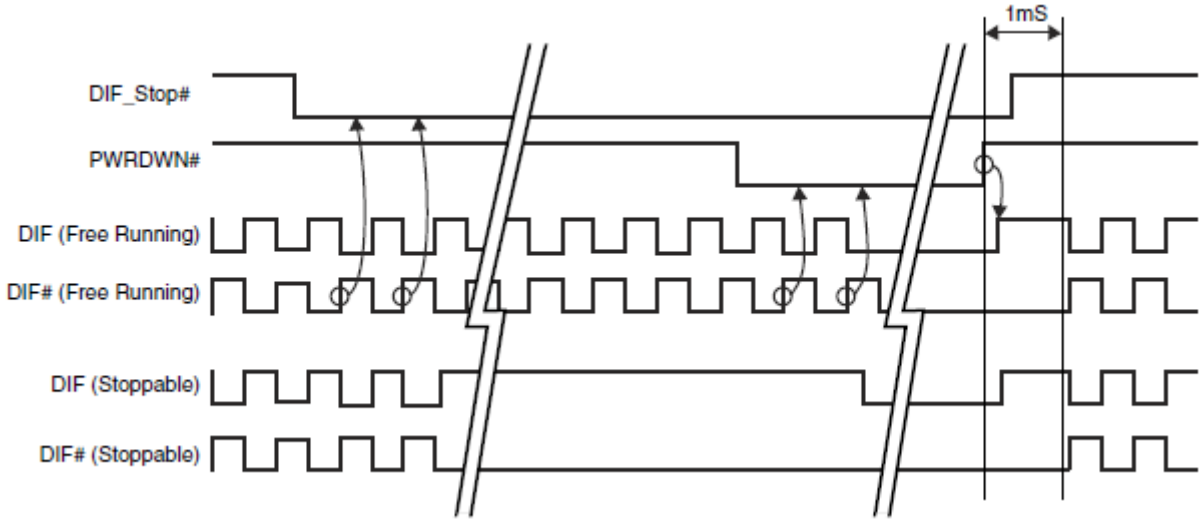
DIF_STOP_2 (Stop_Mode = Tristate, PD_Mode = Driven)



DIF_STOP_3 (Stop_Mode = Driven, PD_Mode = Tristate)



DIF_STOP_4 (Stop_Mode = Tristate, PD_Mode = Tristate)

Revision History

Rev.	Issue Date	Description	Page #
A	10/1/2008	1. Updated Electrical Characteristics to add propagation delay and phase noise information. 2. Added SMBus electrical characteristics 3. Added foot note about DIF input running in order for the SMBus interface to work 4. Added foot note to Byte 1 about functionality of OE bits and OE pins 5. Updated clock periods to reflect +/-100ppm input clock tolerance (CK410B+/CK420BQ/CK505). 6. Changed SRC_Stop references to DIF_Stop references for consistency..	Various
B	10/7/2008	Corrected Common Dimensions.	19-20
C	2/4/2010	1. Corrected Polarity of Power Down pin when OE_INV = 1. Power Down is always active low (or PD#). This is a difference from the 9DB803D.	Various
D	8/31/2010	1. Corrected Termination drawings/tables 2. Removed "Polarity Inversion Pin List" table.	Various
E	5/9/2011	1. Update pin 2 pin-name and pin description from VDD to VDDR. This highlights that optimal peformance is obtained by treating VDDR as in analog pin. This is a document update only, there is no silicon change.	Various
F	9/18/2012	Updated Byte 2, bits 0~7 per char review. Outputs can be programmed with Byte 2 to be Stoppable or Free-Run with DIF_Stop pin, not the OE pins.	14
