Notes on Electrical Characteristics:

- ¹Guaranteed by design and characterization, not 100% tested in production.
- ²Slew rate measured through Vswing centered around differential zero
- ³Vxabs is defined as the voltage where CLK = CLK#
- ⁴Only applies to the differential rising edge (CLK rising and CLK# falling)
- ⁵Defined as the total variation of all crossing voltages of CLK rising and CLK# falling. Matching applies to rising edge rate of CLK and falling edge of CLK#. It is measured using a +/-75mV window centered on the average cross point where CLK meets CLK#. The average cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.
- ⁶All Long Term Accuracy and Clock Period specifications are guaranteed assuming that REF is at 14.31818MHz
- ⁷Operation under these conditions is neither implied, nor guaranteed.
- ⁸Maximum input voltage is not to exceed maximum VDD
