### General Description

The 9ZXL0651 is a low-power 6-output differential buffer that meets all the performance requirements of the Intel DB1200Z specification. It consumes 50% less power than standard HCSL devices and has internal terminations to allow direct connection to 85 ohm transmission lines. The 9ZXL0651 is backwards compatible to PCIe Gen1 and Gen2 and QPI 6.4GT/s specifications. A fixed, internal feedback path maintains low drift for critical QPI applications.

<sup>1</sup>Guaranteed by design and characterization, not 100% tested in production.  $C_L = 2\text{pF}$ ,  $Z_o = 85\Omega$  differential trace impedance).

<sup>2</sup> Measured from differential waveform

<sup>3</sup> Slew rate is measured through the Vswing voltage range centered around differential 0V. This results in a +/-150mV window around differential 0V.

<sup>4</sup> Matching applies to rising edge rate for Clock and falling edge rate for Clock#. It is measured using a +/-75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.

<sup>5</sup> Vcross is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock# falling).

<sup>6</sup> The total variation of all Vcross measurements in any particular system. Note that this is a subset of Vcross\_min/max (Vcross absolute) allowed. The intent is to limit Vcross induced modulation by setting  $\Delta\text{-Vcross}$  to be smaller than Vcross absolute.

SMBusTable: PLL Mode, and Frequency Select Register

Byte 0	Pin #	Name	Control Function	Type	0	1	Default
Bit 7	2	PLL Mode 1	PLL Operating Mode Rd back 1	R	See PLL Operating Mode Readback Table		Latch
Bit 6	2	PLL Mode 0	PLL Operating Mode Rd back 0	R	See PLL Operating Mode Readback Table		Latch
Bit 5			Reserved				0
Bit 4			Reserved				0
Bit 3		PLL_SW_EN	Enable S/W control of PLL BW	RW	HW Latch	SMBus Control	0

Bit 1		PLL Mode 0	PLL Operating Mode 1	RW	See PLL Operating Mode Readback Table		1
Bit 0			Reserved				1

**Note:** Setting bit 3 to '1' allows the user to override the Latch value from pin 5 via use of bits 2 and 1. Use the values from the PLL Operating Mode Readback Table. Note that Bits 7 and 6 will keep the value originally latched on pin 5. A warm reset of the system will have to be accomplished if the user changes these bits.
