# imall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

#### **Product Overview**

The A009 BuckBlock<sup>™</sup> High Output Wide Range LED Power Modules are a line of true current regulated drivers for powering LEDs. The LUXdrive BuckBlock<sup>™</sup> line of LED drivers are the ideal choice for powering all types of highbrightness and high-power LED Packages and arrays.

BuckBlock<sup>™</sup> LED drivers provide high efficiency and require no external current limiting resistors. A fast response current-sensing circuit

makes the BuckBlock<sup>™</sup> ideal for applications where flashing or strobe operation of the LED(s) is required.

A dimming input, compatible with many commercially available 0-10V low voltage dimming controls, provides a convenient method to control the brightness of the LEDs. The standard units are potted in an extremely small, low profile package\* and come with 6" 18AWG colored leads.

#### **Features**

- DC input voltage up to 32V
- 1.0A, 1.4A, or 2.1A constant current output\*
- Extremely small form factor\* (2.0"x1.2"x0.38")
- > 18 AWG wires for easy electrical connections
- External analog/digital intensity control
- External potentiometer intensity control (0-100%)
- Continuous output short circuit protection
- Continuous output open circuit protection
- ▶ Input reverse polarity protection with Polarifet<sup>™</sup> Technology
- > Pulse and strobe capable (dim input)
- > 0-10V Dimming compatible with many available controls

#### **Typical Applications**

- Solar & Landscape Lighting
- Architectural Lighting
- Track Lighting
- ► Automotive & Marine Lighting
- Portable Lighting & Flashlights
- Point of Purchase Lighting
- Desk & Reading Lamps
- Signal & marker Lighting
- Flashing & Strobe Lighting
- Cabinet & Display Case Lighting
- Sign & Channel Letters
- Much More...

\* - Custom units can be designed for OEM applications. Contact LUXdrive for more information.

#### **Part Number Identification Table**

Product Selection									
Part Number	DC Input	Drive Current in (mA)	Control/ Dimming	Connection Type					
A009-D-V-1000	10-32V	1000	0-10V	6 Wires					
A009-D-V-1400	10-32V	1400	0-10V	6 Wires					
A009-D-V-2100	10-32V	2100	0-10V	6 Wires					

Notes for Table 1:

1. Custom units available upon request, restrictions apply. Contact LUXdrive for additional details.

#### **Part Number Identification**

The part number is explaned below:

A009- A- B -CCCC

Where:

A009 designates the LUXdrive Product ID for a BuckBlock

A designates Power Input Type (D for DC only)

B designates Dimming Type (V = 0-10V Dimming)

CCCC designates Drive Current (1000 = 1000mA, 1400 = 1400mA, 2100 = 2100mA)

#### **Absolute Maximum Ratings**

Input Voltage	• • • •		 	
Output Voltage	e		 	Vin
DIM Input	• • • •	• • •	 	10V

#### **Typical Characteristics**

Output tolerance (within specified temp. range)	±10%
Efficiency	90%
Input Voltage Minimum	10V <sub>DC</sub>
Max Output Voltage for 1000mA	80% of Vir
Max Output Voltage for 1400mA	75% of Vir
Max Output Voltage for 2100mA	50% of Vin

High Output Wide Range LED Power Module

DATA SHEET Page 3 of 9

**DATA SHEET Page 4 of 9** 

#### **Specifications**

Output current, A009-D-V-1000	1000mA
Output current, A009-D-V-1400	1400mA
Output current, A009-D-V-2100	2100mA
Dimming Input, turn on threshold	1.7V ±5%
Dimming Input, full on threshold	9V ±5%
External pot adjustment range	0%, 5-100% <sup>2</sup>
Output rise time	<1.5ms <sup>3</sup>
Output fall time	<100 μs <sup>3</sup>
Quiescent current (DIM = 0V)	<4.5 mA <sup>3</sup>
Operating temperature (Tcase)	-40-+80°C -40-+125°C

#### **Application Information**

The BuckBlock<sup>™</sup> High Output LED Power Module is a high-efficiency dc to dc converter that delivers a fixed output current by varying the output voltage as required to maintain the specified current . Because the forward voltage of LEDs can change based on several environmental factors as well as the age of the LED, it is important to use this type of driver in an LED system. The higher output currents are ideal for driving multiple strings of LEDs or high-power LED modules. A fast response current-sensing circuit permits the unit to be used in applications where flashing or pulsing of the LEDs is required. Several options are available allowing for use with many types of LEDs and in a variety of operating modes.

#### **Fixed Current Drive**

When the dimming wires (purple/gray) are left unconnected, the A009 is designed to supply its rated current to one or more LED junctions. For example, a 2100mA rated unit will drive up to four white 2100mA LEDs connected in series at  $24V_{DC}$ . Due to the nature of the buck regulator, the input voltage must always be higher than the total forward voltage drop of the LED junction(s) connected in series. Thus, for a series string of four junctions having an average forward drop of 3.15V each, the required minimum input voltage will be  $24V_{DC}$ . A standard  $24V_{DC}$  power supply is a good choice for this application. Refer to page three for the max Vout/Vin ratings for the various drive currents.

Figures 10 and 11 show a 1400mA and 2100mA unit driving multiple LEDs. Note that parallel strings of LEDs can be driven directly with no additional circuitry required to insure current sharing. The nature of the LEDs themselves will provide sufficient current sharing if the parallel strings comprise three or more junctions each, and are identical in length.

2 - Actual value varies greatly based on input and/or output voltages. Actual values will be smaller in most applications.

3 - Refer to figure 9 for the dimming response.

#### Adjustable Current - External Control - "V" Model

Figures 14 and 15 show the ease of dimming the A009 BuckBlock<sup>TM</sup> High Output LED Power Module. Figure 14 shows the simplest dimming configuration using a 20K Ohm potentiometer. This gives a 0-100% range of dimming. If multiple A009 modules are to be dimmed with a single potentiometer, the value of the potentiometer should be approximately ( $20K\Omega/N$ ) where N is the number of modules.

Figure 15 shows a 0-10V wall dimmer, such as LEDdynamics A019 Low Voltage Dimming Control, being used to control the LED brightness. This is the preferred choice for dimming multiple units, as the 0-10V dimmer can handle several drivers. The 0-10V input can also be supplied by a commercial lighting controller that has **current-sinking** 0-10V outputs, allowing the integration of LEDs with other forms of lighting in large automated systems.

For large systems where several distant BuckBlock modules will be dimmed together, it is imporant to use a heavier gauge wire (such as 18AWG) to run the DIM lines in a star wiring pattern (where each module has a run all the way back to the dimmer). This will help to negate any voltage drops along the DIM wires that could cause some lamps to dim differently than others.

For more advanced control, the 0-10V input can be Pulse Width Modulated (PWM). Figure 18 shows how interfacing with a microcontroller can easily be accomplished with a 2N3904 or equivalent transistor. A PWM frequency of 200Hz is recommended. This configuration can also be used to strobe or pulse the LEDs with a TTL or CMOS logic signal.

In addition to the configurations described above, the BuckBlock may also be driven by a D to A converter. The D/A converter must be able to sink at least 1 ma of current from the 0-10V input of the BuckBlock. If the D/A converter cannot sink current, a voltage follower with an open collector output should be used between the D/A coverter and the 0-10V input.

If the dimming control circuit used with the BuckBlock has the potential to exceed 10V, current into the DIM input needs to be limited to 10mA or less. See figure 8.

#### A009 BuckBlock<sup>™</sup> High Output Wide Range LED Power Module DATA SHEET Page 6 of 9

**External On/Off Control** 

Where a manual on/off control is desired, the potentiometer in Figure 14 may be replaced by a pushbutton or toggle switch. The output current will be zero and the input current will drop to the quiescent level when the switch is closed. Figures 16 and 17 show external dimming control combined with on/off control.

#### **Thermal Management**

The BuckBlock can run many LED load configurations with no aditional heat sinking in an ambient of 25°C. In situations with elevated ambient temperatures, such as those that might be experience inside an enclosed fixture, additional heat sinking may be required. If the temperature of the driver (as measured at the T marking on the label) exceeds 60°C, additional heat sinking is recommended. If the temperature of the driver exceeds 80°C, additional heat sinking is required.

The best surface for removing heat form the BuckBlock is the back side (opposite the labeled side). The module can be attached to a heat sink with thermal grease and a mounting bracket that presses the unit firmly against the heat sink, or with double-sided tape that provides both the thermal path and mechanical mounting. When using tape (such as 3M F9469PC, a Very High Bond (VHB) tape suitable for permanent mounting), using a thinner variety (0.005" thick or less) will aid in getting the heat through the tape and to the heat sink. Care should be taken when positioning the BuckBlock module with VHB tape as the high bond strength makes removing or repositioning the module very difficult.

If the BuckBlock becomes too hot during use, it will reduce the output current to limit the power dissipation. If the temperature continues to rise, the driver will turn off until the temperature drops to a safe level.

#### Connections

In all cases, the LEDs being driven should be located as close to the A009 LED output as possible. 18AWG wire should be adequate for most wiring, but a heavier gauge should be considered when the long leads are required.

The power input wires should also be kept short. Where the power soure is located several feet from the unit, a 100µF or larger, 50V capacitor may be required across the input terminals as shown in Figure 20.
