

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

High-performance class-G stereo headphone amplifier with I²C volume control

Datasheet - production data

Features

- Power supply range: 2.3 V to 4.8 V
- 0.6 mA/channel quiescent current
- 2.1 mA current consumption with 100 μ W/channel (10 dB crest factor)
- 0.006% typical THD+N at 1 kHz
- 100 dB typical PSRR at 217 Hz
- 100 dB of SNR A-weighted at G = 0 dB
- Zero pop and click
- I²C interface for volume control
- Digital volume control range from -60 dB to +4 dB
- Independent right and left channel shutdown control
- Integrated high-efficiency buck converter
- Low software standby current: 5 μ A max
- Output coupling capacitors removed
- Thermal shutdown and short-circuit protection
- Flip-chip package: 1.65 mm x 1.65 mm, 400 μ m pitch, 16 bumps

Applications

- Cellular /smart phones, portable media players
- Wearable
- Fitness and healthcare

Description

The A22H165M is a class-G stereo headphone driver dedicated to high audio performance, high power efficiency and space-constrained applications such as wearable and fitness.

It is based on the core technology of a low power dissipation amplifier combined with a high efficiency buck converter for supplying this amplifier.

When powered by a battery, the buck converter generates the appropriate voltage to the amplifier depending on the amplitude of the audio signal to supply the headsets. It achieves a total 2.1 mA current consumption at 100 μ W output power (10 dB crest factor).

THD+N is 0.02% maximum at 1 kHz and PSRR is 100 dB at 217 Hz, which ensures a high audio quality of the device in a wide range of environments.

The traditionally bulky output coupling capacitors can be removed.

A dedicated common-mode sense pin removes parasitic ground noise.

The A22H165M is designed to be used with an output serial resistor. It ensures unconditional stability over a wide range of capacitive loads. The A22H165M is packaged in a tiny 16-bump flip-chip package with a pitch of 400 μ m.

1 Absolute maximum ratings and operating conditions

Table 1. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{CC}	Supply voltage ⁽¹⁾ during 1 ms.	5.5	V
V_{in+}, V_{in-}	Input voltage referred to ground	+/- 1.2	V
T_{stg}	Storage temperature	-65 to +150	°C
T_j	Maximum junction temperature ⁽²⁾	150	°C
R_{thja}	Thermal resistance junction to ambient ⁽³⁾	200	°C/W
P_d	Power dissipation	Internally limited ⁽⁴⁾	
ESD	Human body model (HBM) ⁽⁵⁾ All pins VOU _{TR} , VOU _{TL} vs. AGND	2 4	kV
	Machine model (MM), min. value ⁽⁶⁾	100	V
	Charge device model (CDM) All pins VOU _{TR} , VOU _{TL}	500 750	V
	IEC61000-4-2 level 4, contact ⁽⁷⁾ IEC61000-4-2 level 4, air discharge ⁽⁷⁾	+/- 8 +/- 15	kV
	Latch-up	Latch-up immunity	200
	Lead temperature (soldering, 10 sec)	260	°C

- All voltage values are measured with respect to the ground pin.
- Thermal shutdown is activated when maximum junction temperature is reached.
- The device is protected from over-temperature by a thermal shutdown mechanism, active at 150° C.
- Exceeding the power derating curves for long periods may provoke abnormal operation.
- Human body model: a 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5 kΩ resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.
- Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω). This is done for all couples of connected pin combinations while the other pins are floating.
- The measurement is performed on an evaluation board, with ESD protection EMIF02-AV01F3.

Table 2. Operating conditions

Symbol	Parameter	Value	Unit
V_{CC}	Supply voltage	2.3 to 4.8	V
HPVDD	Buck DC output voltages High rail voltage Low rail voltage	1.9 1.2	V
SDA, SCL	Input voltage range	GND to V_{CC}	V
R_L	Load resistor	≥ 16	Ω
C_L	Load capacitor Serial resistor of 12 Ω minimum, $R_L \geq 16 \Omega$	0.8 to 100	nF
T_{oper}	Operating free air temperature range	-40 to +85	$^{\circ}\text{C}$
R_{thja}	Flip-chip thermal resistance junction to ambient	90	$^{\circ}\text{C/W}$

2 Typical application schematic

Figure 1. Typical application schematic for the A22H165M

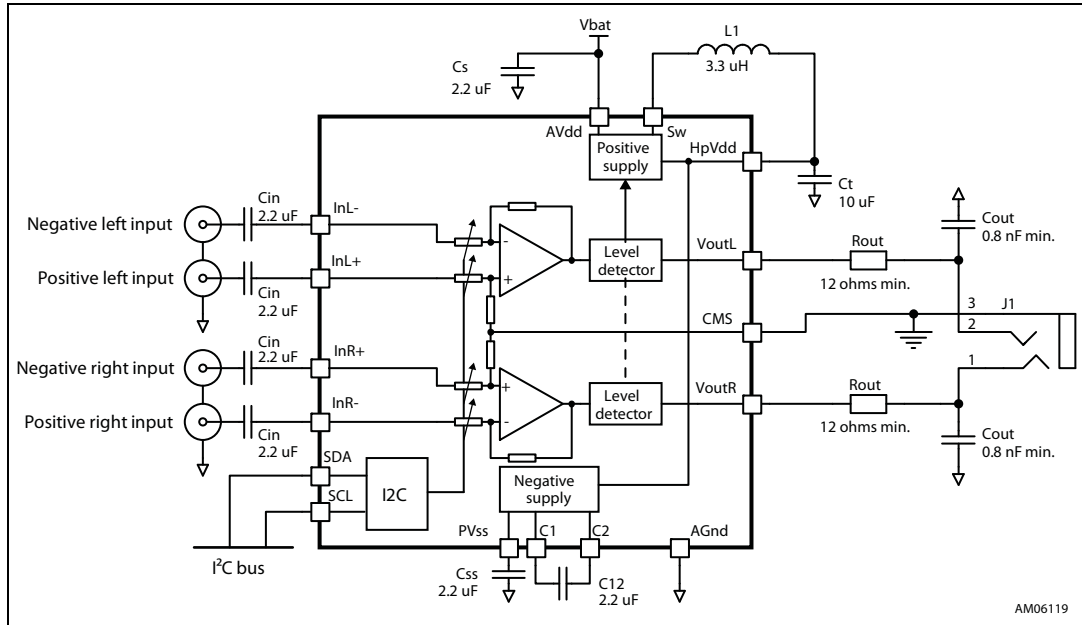

Table 3. A22H165M pin description

Pin n°	Pin name	Pin definition
A1	SW	Switching node of the buck converter
A2	AVDD	Analog supply voltage, connect to battery
A3	VOUTL	Output signal for left audio channel
A4	INL-	Negative input signal for left audio channel
B1	AGND	Device ground
B2	C1	Flying capacitor terminal for internal negative supply generator
B3	HPVDD	Buck converter output, power supply for amplifier
B4	INL+	Positive input signal for left audio channel
C1	C2	Flying capacitor terminal for internal negative supply generator
C2	PVSS	Negative supply generator output
C3	CMS	Common mode sense, to be connected as close as possible to the ground of headphone/line out plug
C4	INR+	Positive input signal for right audio channel
D1	SDA	I ² C data signal, up to V _{CC} tolerant input
D2	SCL	I ² C clock signal, up to V _{CC} tolerant input
D3	VOUTR	Output signal for right audio channel
D4	INR-	Negative input signal for right audio channel

Table 4. A22H165M component description

Component	Value	Description
C _s	2.2 μF	Decoupling capacitors for V _{CC} . A 2.2 μF capacitor is sufficient for proper decoupling of the A22H165M. An X5R dielectric and 10 V rating voltage is recommended to minimize ΔC/ΔV when V _{CC} = 4.8 V. Must be placed as close as possible to the A22H165M to minimize parasitic inductance and resistance.
C ₁₂	2.2 μF	Capacitor for internal negative power supply operation. An X5R dielectric and 6.3 V rating voltage is recommended to minimize ΔC/ΔV when HPVDD = 1.9 V. Must be placed as close as possible to the A22H165M to minimize parasitic inductance and resistance.
C _{SS}	2.2 μF	Filtering capacitor for internal negative power supply. An X5R dielectric and 6.3 V rating voltage is recommended to minimize ΔC/ΔV when HPVDD = 1.9 V.
C _{in}	$C_{in} = \frac{1}{2\pi Z_{in} F_c}$	Input coupling capacitor that forms with Z _{in} /2 a first-order high-pass filter with a -3 dB cutoff frequency F _c . For example, at maximum gain G = 4 dB, Z _{in} = 12.5 kΩ, C _{in} = 2.2 μF, therefore F _c = 6 Hz.
C _{out}	0.8 to 100 nF	Output capacitor of 0.8 nF minimum to 100 nF maximum. This capacitor is mandatory for operation of the A22H165M.
R _{out}	12 Ω min.	Output resistor in-series with the A22H165M output. This 12 Ω minimum resistor is mandatory for operation of the A22H165M.
L1	3.3 μH	Inductor for the buck converter. References of inductors: FDK: MIPSZ2012D3R3 (DC resistance = 0.19 Ω, rated current = 0.8 A) Murata: LQM2MPN3R3G0 (DC resistance = 0.12 Ω, rated current = 1.2 A)
C _t	10 μF	Tank capacitor for internal buck converter. An X5R dielectric and 6.3 V rating voltage is recommended to minimize ΔC/ΔV when HPVDD = 1.9 V. ESR of the C _t capacitor must be as low as possible to obtain the best buck efficiency.

3 Electrical characteristics

$V_{CC} = +3.6\text{ V}$, $AGND = 0\text{ V}$, $T_{amb} = 25\text{ °C}$ (unless otherwise specified)

Table 5. Electrical characteristics of the I²C interface

Symbol	Parameter	Min.	Typ.	Max.	Unit
V_{IL}	Low level input voltage on SDA, SCL pins			0.6	V
V_{IH}	High level input voltage on SDA, SCL pins	1.2			V
V_{OL}	Low level output voltage, SDA pin, $I_{sink} = 3\text{ mA}$			0.4	V
I_{in}	Input current on SDA, SCL		$\frac{V_{SDA, SCL}}{600k\Omega}$	10	μA

$V_{CC} = +3.6\text{ V}$, $AGND = 0\text{ V}$, $R_L = 32\ \Omega + 15\ \Omega$, $T_{amb} = 25\text{ °C}$ (unless otherwise specified)

Table 6. Electrical characteristics of the amplifier

Symbol	Parameter	Min.	Typ.	Max.	Unit
I_{CC}	Quiescent supply current, no input signal, both channels enabled		1.2	1.5	mA
I_s	Supply current, with input modulation, both channels enabled, $HPVDD = 1.2\text{ V}$, output power per channel, $F=1\text{ kHz}$ Pout = 100 μW at 3 dB crest factor Pout = 500 μW at 3 dB crest factor Pout = 1 mW at 3 dB crest factor Pout = 100 μW at 10 dB crest factor Pout = 500 μW at 10 dB crest factor Pout = 1 mW at 10 dB crest factor		2.3 3.7 4.7 2.1 3.1 3.9	3.5 5 6.5	mA
I_{STBY}	Standby current, no input signal, I ² C CR1 = 01h $V_{SDA} = 0\text{ V}$, $V_{SCL} = 0\text{ V}$		0.6	5	μA
V_{in}	Input differential voltage range ⁽¹⁾			1	V_{rms}
V_{oo}	Output offset voltage No input signal	-500		+500	μV
V_{out}	Maximum output voltage, in-phase signals $R_L = 16\ \Omega$, THD+N = 1% max, $f = 1\text{ kHz}$ $R_L = 47\ \Omega$, THD+N = 1% max, $f = 1\text{ kHz}$ $R_L = 10\text{ k}\Omega$, $P_s = 15\ \Omega$, $X_L = 1\text{ v}\Phi$, THD+N = 1% max, $f = 1\text{ kHz}$	0.6 1.0 1.0	0.8 1.1 1.3		V_{rms}
THD+N	Total harmonic distortion + noise, $G = 0\text{ dB}$ $V_{out} = 700\text{ mV}_{rms}$, $F = 1\text{ kHz}$ $V_{out} = 700\text{ mV}_{rms}$, $20\text{ Hz} < F < 20\text{ kHz}$		0.006 0.05	0.02	%

Table 6. Electrical characteristics of the amplifier (continued)

Symbol	Parameter	Min.	Typ.	Max.	Unit
PSRR	Power supply rejection ratio ⁽¹⁾ , $V_{ripple} = 200 \text{ mV}_{pp}$, grounded inputs $F = 217 \text{ Hz}$, $G = 0 \text{ dB}$, $R_L \geq 16 \Omega$ $F = 10 \text{ kHz}$, $G = 0 \text{ dB}$, $R_L \geq 16 \Omega$	90	100 70		dB
CMRR	Common mode rejection ratio $F = 1 \text{ kHz}$, $G = 0 \text{ dB}$, $V_{ic} = 200 \text{ mV}_{pp}$ $F = 20 \text{ Hz to } 20 \text{ kHz}$, $G = 0 \text{ dB}$, $V_{ic} = 200 \text{ mV}_{pp}$		65 45		dB
Crosstalk	Channel separation $R_L = 32 \Omega + 15 \Omega$, $G = 0 \text{ dB}$, $F = 1 \text{ kHz}$, $P_o = 10 \text{ mW}$ $R_L = 10 \text{ k}\Omega$, $G = 0 \text{ dB}$, $F = 1 \text{ kHz}$, $V_{out} = 1 \text{ V}_{rms}$	60 80	100 110		dB
SNR	Signal-to-noise ratio, A-weighted, $V_{out} = 1 \text{ V}_{rms}$, $\text{THD+N} < 1\%$, $F = 1 \text{ kHz}$ ⁽¹⁾ $G = +4 \text{ dB}$ $G = +0 \text{ dB}$	99 100			dB
ONoise	Output noise voltage, A-weighted ⁽¹⁾ $G = +4 \text{ dB}$ $G = +0 \text{ dB}$		9	11 9	μV_{rms}
G	Gain range with gain (dB) = $20 \times \log[(V_{outL/R}) / (\lnL/R+ - \lnL/R-)]$	-60		+4	dB
Mute	$\lnL/R+ - \lnL/R- = 1 \text{ V}_{rms}$			-80	dB
-	Gain step size error	-0.5		+0.5	step-size
-	Gain error ($G = +4 \text{ dB}$)	-0.45		+0.42	dB
Z_{in}	Differential input impedance	25	34		k Ω
	Input impedance during wake-up phase (referred to ground)		2		k Ω
Z_{out}	Output impedance when $\text{CR1} = 00\text{h}$ (negative supply is ON and amplifier output stages are OFF) ⁽¹⁾ $F < 40 \text{ kHz}$ $F = 6 \text{ MHz}$ $F = 36 \text{ MHz}$	10 500 75			k Ω Ω Ω
t_{wu}	Wake-up time ⁽²⁾		12	16	ms
t_{stby}	Standby time		100		μs
t_{atk}	Attack time. Setup time between low rail buck voltage and high rail buck voltage		100		μs
t_{dcy}	Decay time		50		ms

1. Guaranteed by design and parameter correlation.
2. Refer to the application information in [Section 4.3 on page 27](#).

Table 7. Timing characteristics of the I²C interface for I²C interface signals over recommended operating conditions (unless otherwise specified)

Symbol	Parameter	Min.	Typ.	Max.	Unit
f_{SCL}	Frequency, SCL			400	kHz
$t_{d(H)}$	Pulse duration, SCL high	0.6			μ s
$t_{d(L)}$	Pulse duration, SCL low	1.3			μ s
t_{st1}	Setup time, SDA to SCL	100			ns
t_{h1}	Hold time, SCL to SDA	0			ns
t_f	Bus free time between stop and start condition	1.3			μ s
t_{st2}	Setup time, SCL to start condition	0.6			μ s
t_{h2}	Hold time, start condition to SCL	0.6			μ s

4 Application information

4.1 I²C bus interface

In compliance with the I²C protocol, the A22H165M uses a serial bus to control the chip's functions with the clock (SCL) and data (SDA) wires. These two lines are bi-directional (open collector) and require an external pull-up resistor (typically 10 kΩ). The maximum clock frequency in fast mode specified by the I²C standard is 400 kHz, which the A22H165M supports. In this application, the A22H165M is always the slave device and the controlling microcontroller MCU is the master device.

The slave address of the A22H165M is 1100 000x (C0h).

[Table 8](#) summarizes the pin descriptions for the I²C bus interface.

Table 8. I²C bus interface pin descriptions

Pin	Functional description
SDA	Serial data pin
SCL	Clock input pin

4.1.1 I²C bus operation

The host MCU can write to the A22H165M control register to control the A22H165M, and read from the control register to obtain a configuration from the A22H165M. The A22H165M is addressed by the byte consisting of the 7-bit slave address and the R/W bit.

Table 9. First byte after the START message for addressing the device

A6	A5	A4	A3	A2	A1	A0	R/W
1	1	0	0	0	0	0	X

There are four control registers ([Table 10](#)) named CR1 to CR4. In read mode, all the control registers can be accessed. In write mode, only CR1, CR2 and CR3 can be addressed.

Table 10. Summary of control registers

Description	Register address	D7	D6	D5	D4	D3	D2	D1	D0
CR1	1	HP_EN_L	HP_EN_R	0	0	SC_L	SC_R	T_SH	SWS
CR2 volume control	2	Mute_L	Mute_R	Volume control				0	
CR3	3	0	0	0	0	0	0	HiZ_L	HiZ_R
CR4 identification	4	0	1	0	0	0	0	0	0

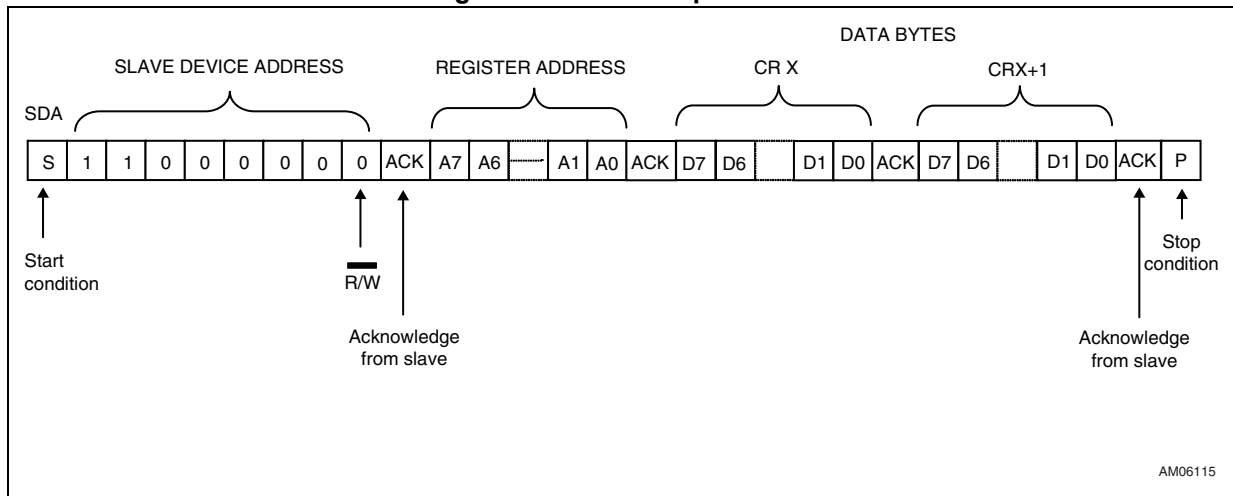

Writing to the control registers

To write data to the A22H165M, after the "start" message the MCU must:

- send the I²C 7-bit slave address and a low level for the R/W bit.
- send the register address to write to.
- send the data bytes (control register settings).

All bytes are sent MSB first. The transfer of written data ends with a "stop" message. When transmitting several data bytes, the data can be written without having to repeat the "start" message or send the byte with the slave address. If several bytes are transmitted, they will be written repeatedly to CR1, CR2 and CR3.

Figure 72. I²C write operations

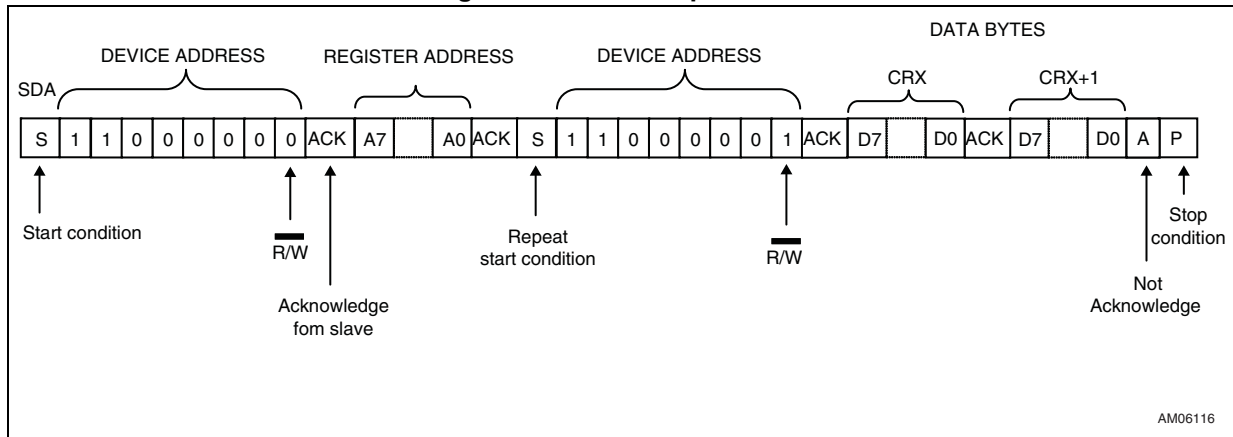

Reading from the control registers

To read data from the A22H165M, after the "start" message the MCU must:

- send the I²C 7-bit slave address and a low level for the R/W bit.
- send the register address to write to.
- send the I²C 7-bit slave address and a high level for the R/W bit.
- receive the data (control register value).

All bytes are read MSB first. The transfer of read data ends with a "stop" message. When transmitting several data bytes, the data can be read without having to repeat the "start" message or send the byte with the slave address. If several bytes are transmitted, they will be read repeatedly from CR1, CR2, CR3 and CR4.

Figure 73. I²C read operations

4.1.2 Control register CR2 - address 2

Table 11. Volume control register CR2 - address 2

Volume control range: -60 dB to +4 dB

0	1	0	1	0	-23 dB	1	1	0	1	0	-1 dB
0	1	0	1	1	-21 dB	1	1	0	1	1	0 dB
0	1	1	0	0	-19 dB	1	1	1	0	0	+1 dB
0	1	1	0	1	-17 dB	1	1	1	0	1	+2 dB
0	1	1	1	0	-15 dB	1	1	1	1	0	+3 dB
0	1	1	1	1	-13 dB	1	1	1	1	1	+4 dB

Mute function: bits MUTE_L and MUTE_R

In the volume register, MUTE_L and MUTE_R are dedicated to enabling the mute function, independently of the channel. When MUTE_L and MUTE_R are set to V_{IH}, the mute function is enabled on the corresponding channel and the gain is set to -80 dB. When MUTE_L and MUTE_R are set to V_{IL}, the I²C gain level is applied to the channel.

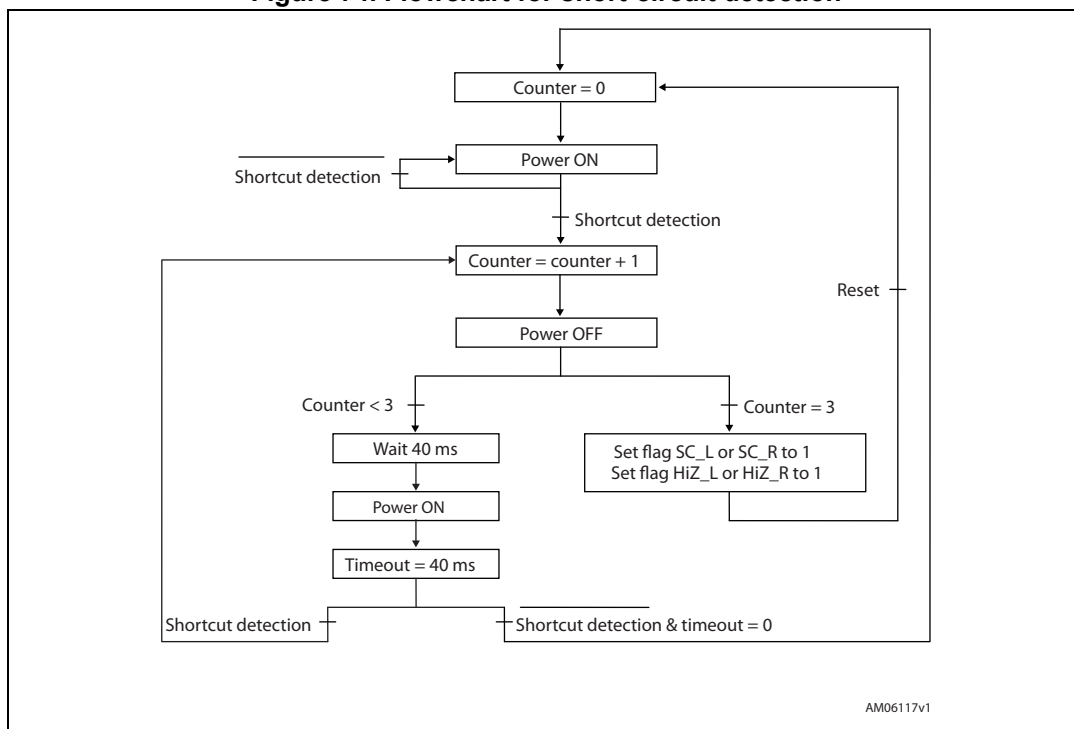

4.1.3 Control register CR1 - address 1

Amplifier output short-circuit detection: bits SC_L and SC_R

The amplifier’s outputs are protected from short-circuit that might accidentally occur during manipulation of the device. In a typical application, if a short-circuit arises on the jack plug, there will be no detection because of the serial resistor present on the amplifier output, thus the output current threshold will not be reached.

To be active, the detection has to occur directly on the amplifier’s output with a signal modulation on the inputs of the A22H165M. This detection is depicted in [Figure 74](#).

Figure 74. Flowchart for short-circuit detection

If a short-circuit is detected three consecutive times on one channel, a flag is raised in the I²C read register CR1.

- SC_L: equals 0 during normal operation, equals 1 when a short-circuit is detected on the left channel.
- SC_R: equals 0 during normal operation, equals 1 when a short-circuit is detected on the right channel.

The corresponding channel’s output stage is then set to high impedance mode. An I²C read command allows the reading of the SC_L and SC_R flags but does not reset them. An I²C write command has to be sent to CR1 to reset the flags to 0 and restore normal operation.
