

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Hall Effect Direction Detection Sensor IC

Last Time Buy

These parts are in production but have been determined to be LAST TIME BUY. This classification indicates that the product is obsolete and notice has been given. Sale of this device is currently restricted to existing customer applications. The device should not be purchased for new design applications because of obsolescence in the near future. Samples are no longer available.

Date of status change: May 4, 2009

Deadline for receipt of LAST TIME BUY orders: November 4, 2009

Recommended Substitutions:

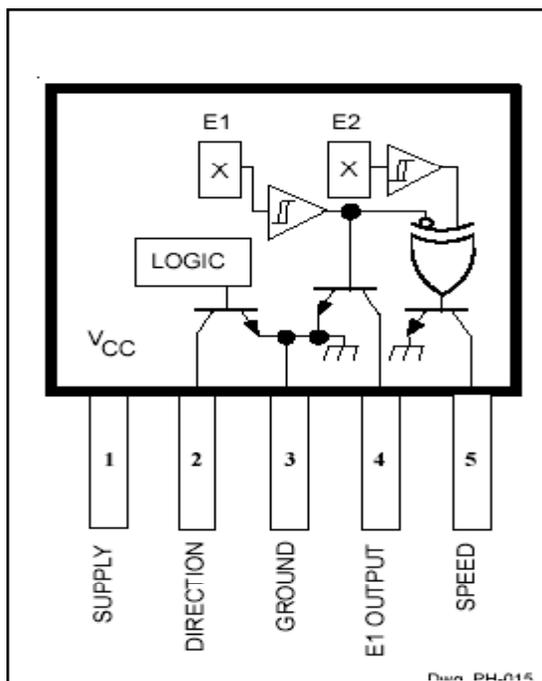

For existing customer transition, and for new customers or new applications, refer to the [A3423](#).

NOTE: For detailed information on purchasing options, contact your local Allegro field applications engineer or sales representative.

Allegro MicroSystems, Inc. reserves the right to make, from time to time, revisions to the anticipated product life cycle plan for a product to accommodate changes in production capabilities, alternative product availabilities, or market demand. The information included herein is believed to be accurate and reliable. However, Allegro MicroSystems, Inc. assumes no responsibility for its use; nor for any infringements of patents or other rights of third parties which may result from its use.

HALL-EFFECT, DIRECTION-DETECTION SENSOR IC

Pinning is shown viewed from branded side.

ABSOLUTE MAXIMUM RATINGS

Supply Voltage, V_{CC}	18 V
Magnetic Flux Density, B	Unlimited
Output OFF Voltage, V_{OUT}	V_{CC}
Output Sink Current, I_{OUT}	30 mA
Package Power Dissipation, P_D	500 mW
Operating Temperature Range, T_A	
Suffix 'E-'	-40°C to +85°C
Suffix 'L-'	-40°C to +150°C
Storage Temperature Range, T_S	-65°C to +170°C

The A3422xKA Hall-effect, direction-detection sensor IC is a new generation of special-function integrated devices that is applicable to sensing the direction of rotation of a ring magnet. This transducer provides separate digital outputs that provide information on magnet rotation speed, direction, and magnet pole count. This device eliminates the major manufacturing hurdles encountered in fine-pitch direction-detection applications, namely maintaining accurate mechanical location between the two active Hall elements. Here, the two Hall elements are photolithographically aligned to better than 1 μm , as contrasted with 100 μm or worse mechanical location tolerance when manufactured discretely. This highly sensitive, temperature-stable, magnetic transducer is ideal for use in digital-encoder systems in the harsh environments of automotive or industrial applications. The A3422xKA is a high-sensitivity device optimized for use with high-density magnets.

The A3422xKA monolithic integrated circuit contains two independent Hall-effect bipolar switches whose digital outputs are internally coupled to CMOS logic circuitry that decodes signal speed and direction. Extremely low-drift BiCMOS circuitry is used for the amplifiers to ensure symmetry between the two switches so that signal quadrature can be maintained. An on-chip voltage regulator allows the use of this device from a 4.5 V to 18 V supply. The outputs are standard open-collector outputs.

Two operating temperature ranges are provided; suffix 'E-' is for the automotive and industrial temperature range of -40°C to +85°C, suffix 'L-' is for the automotive and military temperature range of -40°C to +150°C. The 5-pin 'KA' SIP package provides a cost-competitive solution to magnetic sensing in harsh environments.

FEATURES

- Internal Direction-Decoding Circuitry
- Two Matched Hall Bipolar Switches on a Single Substrate
- Superior Temperature Stability
- 4.5 V to 18 V Operation
- Electrically Defined Power-On State
- Undervoltage Lockout

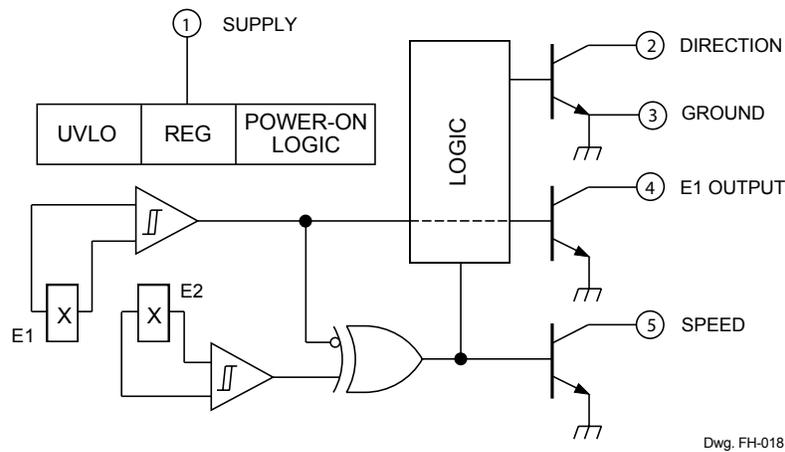

3422 HALL-EFFECT, DIRECTION-DETECTION SENSOR IC

Selection Guide

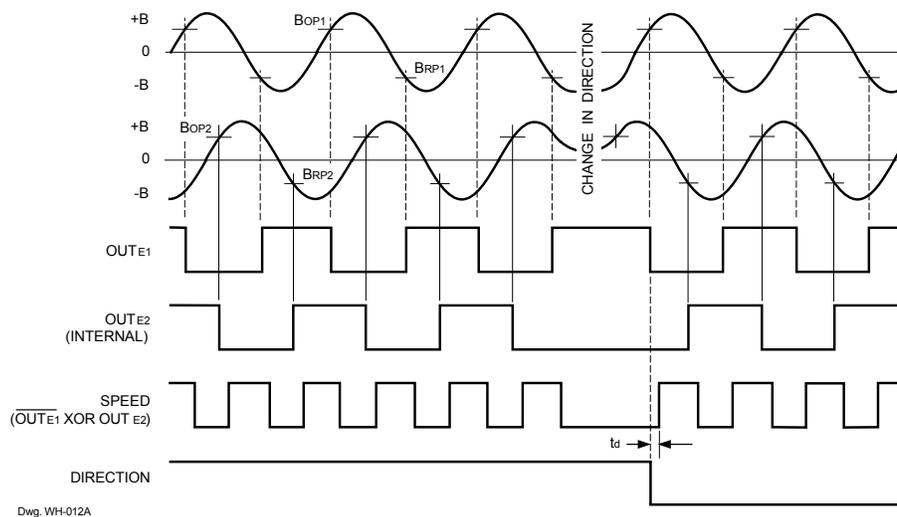

Part Number	Packing*	Mounting	Ambient, T _A (°C)
A3422EKA-T	Bulk, 500 pieces/bag	5-pin SIP through hole	-40 to 85
A3422LKA-T	Bulk, 500 pieces/bag	5-pin SIP through hole	-40 to 150

*Contact Allegro for additional packing options.

FUNCTIONAL BLOCK DIAGRAM

Typical Electrical Characteristics

3422 HALL-EFFECT, DIRECTION-DETECTION SENSOR IC

Functional Description

The integrated circuit contains an internal voltage regulator that powers the Hall elements and both the analog and digital circuitry. This regulator allows operation over a wide supply voltage range and provides some immunity to supply noise. The device also contains CMOS logic circuitry that decodes the direction of rotation of the ring magnet.

Quadrature/Direction Detection. Internal logic circuitry provides outputs representing speed and direction of the magnetic field across the face of the package. For the direction signal to be appropriately updated, a quadrature relationship must be maintained between the ring magnet pole width*, the element-to-element spacing, and, to a lesser extent, the magnetic switch points. For optimal design, the device should be actuated with a ring magnet pole width* two times the sensor-to-sensor spacing. This will produce a sinusoidal magnetic field whose period (denoted as T) is then four times the element-to-element spacing. A quadrature relationship can also be maintained for a ring magnet that has a period that satisfies the relationship $nT/4 = 1.5 \text{ mm}$, where n is any odd integer. Therefore, ring magnets with pole-pair spacings equal to 6 mm ($n = 1$), 2 mm ($n = 3$), 1.2 mm ($n = 5$), etc. are permitted.

The response of the device to the magnetic field produced by a rotating ring magnet is shown on page 2. Note the phase shift between the two elements.

*“Pole” refers to a single pole (North or South) unless stated as “pole pair” (North and South).

Outputs. The device provides three saturated outputs: DIRECTION, E1 OUTPUT, and SPEED. DIRECTION provides the direction output of the device and is defined as OFF (high) for the direction E1 to E2 and ON (low) for the direction E2 to E1. SPEED provides an XOR'd output of the two elements. Because of internal delays, DIRECTION will always be updated before SPEED and is updated at every transition of E1 OUTPUT and E2 OUTPUT (internal) allowing the use of up-down counters without the loss of pulses.

Power-On State. At power on, the logic circuitry is reset to provide an OFF (high) at DIRECTION and an OFF (high) for E1 and E2 (internal) for magnetic fields less than B_{OP} . This eliminates ambiguity when the device is powered up and either element detects a field between B_P and B_{RP} . If either element is subjected to a field greater than B_{OP} , the internal logic will set accordingly.

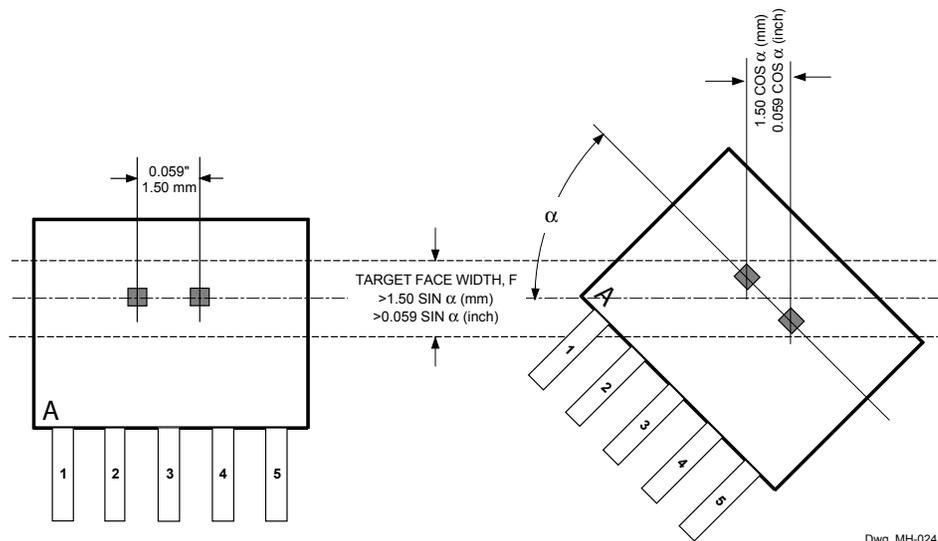

Applications Information

Operation with Fine-Pitch Ring Magnets. For targets with a circular pitch of less than 4mm, a performance improvement can be observed by rotating the front face of the device (see below). This device rotation decreases the effective element-to-element spacing, provided that the Hall elements are not rotated beyond the width of the target.

Applications. It is strongly recommended that an external 0.01 μ F bypass capacitor be connected (in close proximity to the Hall elements) between the supply and ground of the device to reduce both external noise and noise generated by the internal logic.

The simplest form of magnet that will operate these devices is a ring magnet. Other methods of operation, such as linear magnets, are possible. Extensive applications information on magnets and Hall-effect devices is also available in the “Hall-Effect IC Applications Guide” which can be found in the latest issue of the *Allegro MicroSystems Electronic Data Book*, AMS-702 or *Application Note 27701*, or at

Criteria for Device Qualification

Contact Allegro MicroSystems for qualification information.

Element Locations

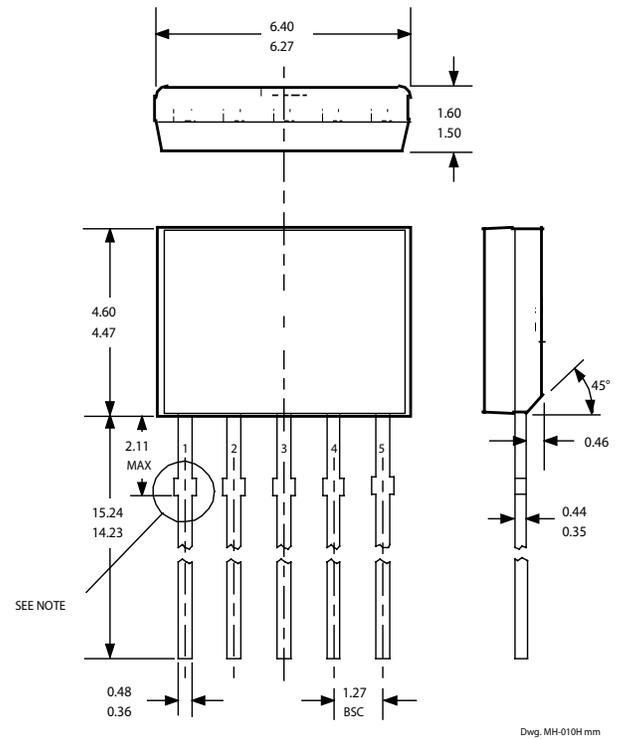

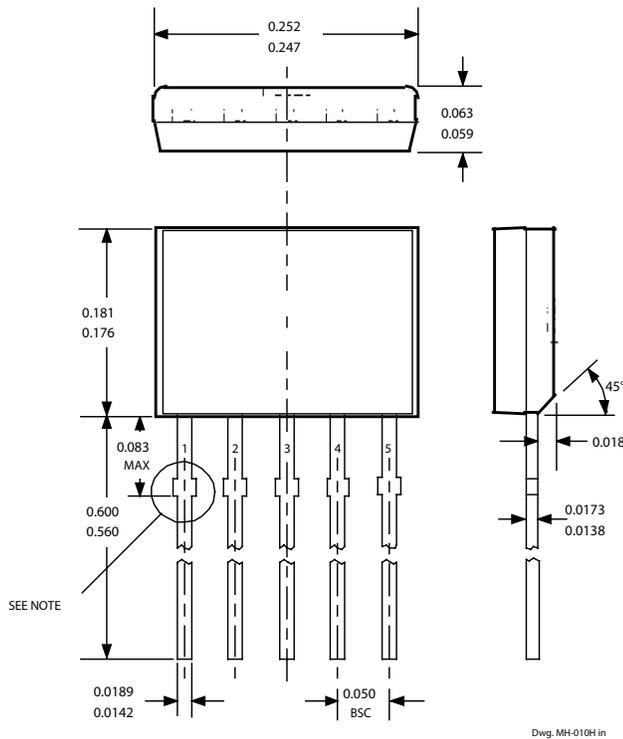

Dwg. MH-007-1A

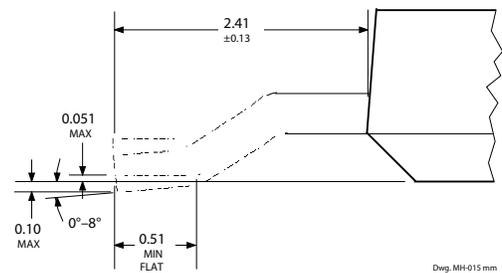

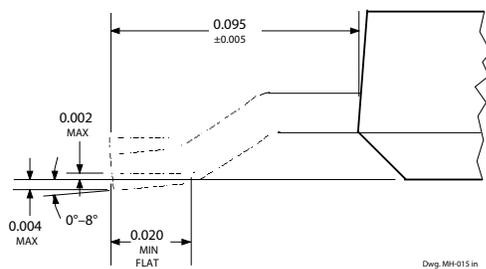

Package Designator 'KA'

Dimensions in Inches
(controlling dimensions)

Dimensions in Millimeters
(for reference only)

Surface-Mount Lead Form (add '-TL' to part number)

- NOTES:
1. Tolerances on package height and width represent allowable mold offsets. Dimensions given are measured at the widest point (parting line).
 2. Exact body and lead configuration at vendor's option within limits shown.
 3. Height does not include mold gate flash.
 4. Recommended minimum PWB hole diameter to clear transition area is 0.035" (0.89 mm).
 5. Where no tolerance is specified, dimension is nominal.
 6. Supplied in bulk pack (500 pieces per bag).
