

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Low Power, 1 MBd Digital Optocoupler

## Data Sheet

### Description

The Broadcom® ACPL-M50L (single-channel in SO-5 footprint), ACPL-054L (dual-channel in SO-8 footprint), ACPL-W50L (single-channel in stretched SO-6 footprint), and ACPL-K54L (dual-channel in stretched SO-8 footprint) are low power, low-input current, 1 MBd digital optocouplers.

These digital optocouplers use an insulating layer between the light-emitting diode and an integrated photon detector to provide electrical insulation between input and output. Separate connections for the photodiode bias and output transistor collector increase the speed up to a hundred times over that of a conventional photo-transistor coupler by reducing the base-collector capacitance.

The ACPL-M50L/054L/W50L/K54L has an increased common mode transient immunity of 15 kV/μs minimum at  $V_{CM} = 1500V$  over a temperature range of  $-40^{\circ}C$  to  $105^{\circ}C$ . The current transfer ratio (CTR) is 140% typical for ACPL-M50L or 130% typical for ACPL-054L/W50L/K54L at  $I_F = 3mA$ . This digital optocoupler can be used in any TTL/CMOS, TTL/LSTTL, or wide bandwidth analog applications.

**CAUTION** Take normal static precautions in handling and assembly of this component to prevent damage and/or degradation that might be induced by electrostatic discharge (ESD). The components featured in this data sheet are not to be used in military or aerospace applications or environments

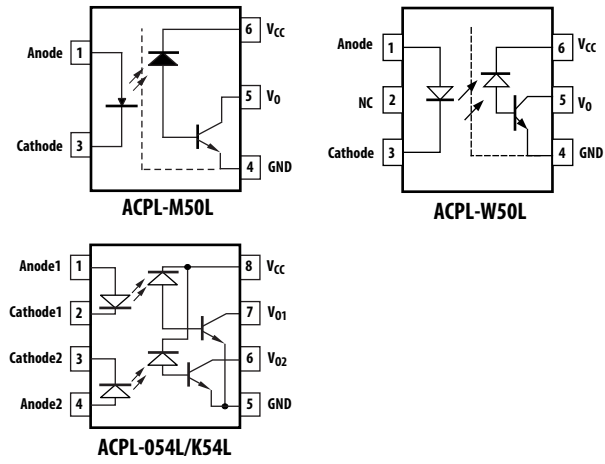

### Features

- Wide supply voltage  $V_{CC}$ : 2.7V to 24V
- Low drive current: 3 mA
- Open-collector output
- TTL compatible
- Compact SO-5, SO-8, stretched SO-6, and stretched SO-8 package
- 15 kV/μs high common-mode rejection at  $V_{CM} = 1500V$
- Guaranteed performance from temperature range:  $-40^{\circ}C$  to  $+105^{\circ}C$
- Low propagation delay: 1 μs max at 5V
- Worldwide safety approval:
  - UL1577 recognized, 3750  $V_{rms}/1$  min for ACPL-M50L/054L, 5000  $V_{rms}/1$  min for ACPL-W50L/K54
  - CSA Approval
  - IEC/EN/DIN EN 60747-5-5 Approval for Reinforced Insulation

### Applications

- Communications interface
- Digital signal isolation
- Micro-controller interface
- Feedback elements in switching power supplies
- Digital isolation for A/D, D/A conversion digital field

### Regulatory Information

The ACPL-M21L/024L/021L/W21L/K24L is approved by the following organizations.

<b>UL</b>	Approval under UL 1577, component recognition program up to $V_{ISO} = 3750 V_{RMS}$ for ACPL-M50L/054L/021L and $V_{ISO} = 5000 V_{RMS}$ for ACPL-W50L/K54L.
<b>CSA</b>	Approval under CSA Component Acceptance Notice #5.
<b>IEC/EN 60747-5-5</b>	(Option 060E only).

- Pulse Width Distortion (PWD) is defined as  $|t_{PHL} - t_{PLH}|$  for any given device.
- The difference between  $t_{PLH}$  and  $t_{PHL}$  between any two parts under the same test condition. (See IPM Dead Time and Propagation Delay Specifications section.)
- Common transient immunity in a Logic High level is the maximum tolerable (positive)  $dV_{CM}/dt$  on the rising edge of the common mode pulse,  $V_{CM}$ , to assure that the output will remain in a Logic High state (i.e.,  $V_O > 2.0\text{V}$ ).
- Common mode transient immunity in a Logic Low level is the maximum tolerable (negative)  $dV_{CM}/dt$  on the falling edge of the common mode pulse signal,  $V_{CM}$  to assure that the output will remain in a Logic Low state (i.e.,  $V_O < 0.8\text{V}$ ).

- Pulse Width Distortion (PWD) is defined as  $|t_{PHL} - t_{PLH}|$  for any given device.
- The difference between  $t_{PLH}$  and  $t_{PHL}$  between any two parts under the same test condition. (See IPM Dead Time and Propagation Delay Specifications section.)
- Common transient immunity in a Logic High level is the maximum tolerable (positive)  $dV_{CM}/dt$  on the rising edge of the common mode pulse,  $V_{CM}$ , to assure that the output will remain in a Logic High state (i.e.,  $V_O > 2.0\text{V}$ ).
- Common mode transient immunity in a Logic Low level is the maximum tolerable (negative)  $dV_{CM}/dt$  on the falling edge of the common mode pulse signal,  $V_{CM}$  to assure that the output will remain in a Logic Low state (i.e.,  $V_O < 0.8\text{V}$ ).

## Package Characteristics

All typical at  $T_A = 25^\circ\text{C}$
