Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Nonvolatile Memory, Dual 1024-Position Digital Potentiometer

Enhanced Product

AD5235-EP

FEATURES

- Dual-channel, 1024-position resolution
- 25 kΩ nominal resistance
- Low temperature coefficient: 35 ppm/°C
- Nonvolatile memory stores wiper settings
- Permanent memory write protection
- Wiper setting readback
- Resistance tolerance stored in EEMEM
- Predefined linear increment/decrement instructions
- Predefined ±6 dB/step log taper increment/decrement instructions
- SPI-compatible serial interface
- 2.7 V to 5 V single supply or ±2.5 V dual supply
- 26 bytes extra nonvolatile memory for user-defined information
- 100-year typical data retention, T_A = 55°C
- Power-on refreshed with EEMEM settings
- Enhanced Features
  - Supports defense and aerospace applications (AQEC)
  - Temperature range: −40°C to +125°C
  - Controlled manufacturing baseline
  - 1 assembly/test site
  - 1 fabrication site
  - Enhanced product change notification
  - Qualification data available on request

APPLICATIONS

- DWDM laser diode driver, optical supervisory systems
- Mechanical potentiometer replacement
- Instrumentation: gain, offset adjustment
- Programmable voltage-to-current conversion
- Programmable filters, delays, time constants
- Programmable power supply
- Low resolution DAC replacement
- Sensor calibration

GENERAL DESCRIPTION

The AD5235-EP is a dual-channel, nonvolatile memory,[1] digitally controlled potentiometer[2] with 1024-step resolution. The device performs the same electronic adjustment function as a mechanical potentiometer with enhanced resolution, solid state reliability, and superior low temperature coefficient performance. The AD5235-EP's versatile programming via an SPI®-compatible serial interface allows 16 modes of operation and adjustment including scratchpad programming, memory storing and restoring, increment/decrement, ±6 dB/step log taper adjustment, wiper setting readback, and extra EEMEM[1] for user-defined information such as memory data for other components, look-up tables, or system identification information.

FUNCTIONAL BLOCK DIAGRAM

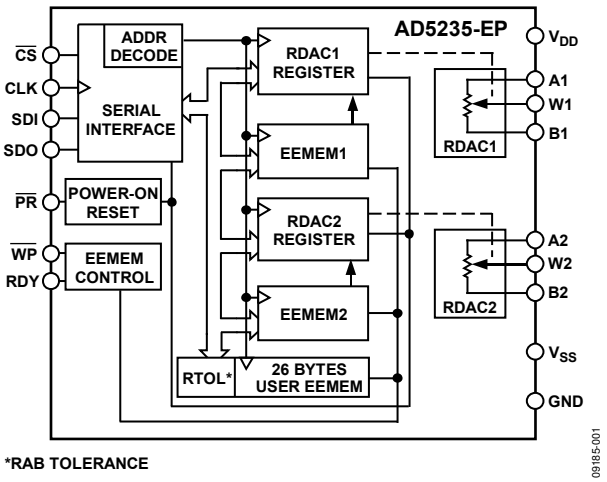

Figure 1.

In scratchpad programming mode, a specific setting can be programmed directly to the RDAC[2] register that sets the resistance between Terminal W and Terminal A, and Terminal W and Terminal B. This setting can be stored into the EEMEM and is restored automatically to the RDAC register during system power-on.

The EEMEM content can be restored dynamically or through external $\overline{PR}$ strobing, and a $\overline{WP}$ function protects EEMEM contents. To simplify the programming, the independent or simultaneous linear-step increment or decrement commands can be used to move the RDAC wiper up or down, one step at a time. For logarithmic ±6 dB changes in the wiper setting, the left or right bit shift command can be used to double or halve the RDAC wiper setting.

The AD5235-EP patterned resistance tolerance is stored in the EEMEM. Therefore, in readback mode, the host processor can know the actual end-to-end resistance. The host can execute the appropriate resistance step through a software routine that simplifies open-loop applications as well as precision calibration and tolerance matching applications.

The AD5235-EP is available in a thin, 16-lead TSSOP package. The part is guaranteed to operate over the extended industrial temperature range of −40°C to +125°C.

Full details about this enhanced product, including theory of operation, register details, and applications information, are available in the AD5235 data sheet, which should be consulted in conjunction with this data sheet.

[1] The terms nonvolatile memory and EEMEM are used interchangeably.
[2] The terms digital potentiometer and RDAC are used interchangeably.

[1] Typicals represent average readings at 25°C and V_{DD} = 5 V.
[2] Resistor position nonlinearity error (R-INL) is the deviation from an ideal value measured between the maximum resistance and the minimum resistance wiper positions. R-DNL measures the relative step change from ideal between successive tap positions. I_W ~ 50 µA for V_{DD} = 2.7 V and I_W ~ 400 µA for V_{DD} = 5 V (see Figure 25).
[3] INL and DNL are measured at V_W with the RDAC configured as a potentiometer divider similar to a voltage output DAC. $V_A = V_{DD}$ and $V_B = V_{SS}$. DNL specification limits of ±1 LSB maximum are guaranteed monotonic operating conditions (see Figure 26).
[4] Resistor Terminal A, Resistor Terminal B, and Resistor Terminal W have no limitations on polarity with respect to each other. Dual-supply operation enables ground-referenced bipolar signal adjustment.
[5] Guaranteed by design and not subject to production test.
[6] Common-mode leakage current is a measure of the dc leakage from any Terminal A, Terminal B, or Terminal W to a common-mode bias level of $V_{DD}/2$.
[7] EEMEM restore mode current is not continuous. Current is consumed while EEMEM locations are read and transferred to the RDAC register (see Figure 22). To minimize power dissipation, a NOP, Instruction 0 (0x0) should be issued immediately after Instruction 1 (0x1).
[8] P_{DISS} is calculated from ($I_{DD} \times V_{DD}$) + ($I_{SS} \times V_{SS}$).
[9] All dynamic characteristics use V_{DD} = +2.5 V and V_{SS} = −2.5 V.

INTERFACE TIMING AND EEMEM RELIABILITY CHARACTERISTICS

Guaranteed by design and not subject to production test. See the Timing Diagrams section for the location of measured values. All input control voltages are specified with $t_R = t_F = 2.5$ ns (10% to 90% of 3 V) and timed from a voltage level of 1.5 V. Switching characteristics are measured using both $V_{DD} = 2.7$ V and $V_{DD} = 5$ V.

Data Retention[8]				100		Years

[1] Typicals represent average readings at 25°C and $V_{DD} = 5$ V.
[2] Propagation delay depends on the value of V_{DD}, $R_{PULL-UP}$, and C_L.
[3] Valid for commands that do not activate the RDY pin.
[4] The RDY pin is low only for Instruction 2, Instruction 3, Instruction 8, Instruction 9, Instruction 10, and the $\overline{PR}$ hardware pulse: CMD_8 ~ 20 µs; CMD_9, CMD_10 ~ 7 µs; CMD_2, CMD_3 ~ 15 ms; $\overline{PR}$ hardware pulse ~ 30 µs.
[5] Store EEMEM time depends on the temperature and EEMEM writes cycles. Higher timing is expected at a lower temperature and higher write cycles.
[6] Not shown in Figure 2 and Figure 3.
[7] Endurance is qualified to 100,000 cycles per JEDEC Standard 22, Method A117 and measured at −40°C, +25°C, and +125°C.
[8] Retention lifetime equivalent at junction temperature (T_J) = 85°C per JEDEC Standard 22, Method A117. Retention lifetime based on an activation energy of 1 eV derates with junction temperature in the Flash/EE memory.

[1] Maximum terminal current is bounded by the maximum current handling of the switches, maximum power dissipation of the package, and maximum applied voltage across any two of the A, B, and W terminals at a given resistance.
[2] Includes programming of nonvolatile memory.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

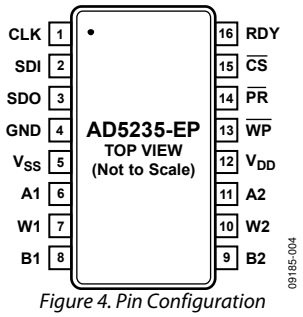

Figure 4. Pin Configuration

Table 4. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	CLK	Serial Input Register Clock. Shifts in one bit at a time on positive clock edges.
2	SDI	Serial Data Input. Shifts in one bit at a time on positive clock CLK edges. MSB loads first.
3	SDO	Serial Data Output. Serves readback and daisy-chain functions. Command 9 and Command 10 activate the SDO output for the readback function, delayed by 24 or 25 clock pulses, depending on the clock polarity before and after the data-word (see Figure 2 and Figure 3). In other commands, the SDO shifts out the previously loaded SDI bit pattern, delayed by 24 or 25 clock pulses depending on the clock polarity (see Figure 2 and Figure 3). This previously shifted out SDI can be used for daisy-chaining multiple devices. Whenever SDO is used, a pull-up resistor in the range of 1 kΩ to 10 kΩ is needed.
4	GND	Ground Pin, Logic Ground Reference.
5	V_{SS}	Negative Supply. Connect to 0 V for single-supply applications. If V_{SS} is used in dual supply, it must be able to sink 35 mA for 30 ms when storing data to EEMEM.
6	A1	Terminal A of RDAC1.
7	W1	Wiper terminal of RDAC1. ADDR (RDAC1) = 0x0.
8	B1	Terminal B of RDAC1.
9	B2	Terminal B of RDAC2.
10	W2	Wiper terminal of RDAC2. ADDR (RDAC2) = 0x1.
11	A2	Terminal A of RDAC2.
12	V_{DD}	Positive Power Supply.
13	$\overline{WP}$	Optional Write Protect. When active low, $\overline{WP}$ prevents any changes to the present contents, except $\overline{PR}$ strobe. CMD_1 and COMD_8 refresh the RDAC register from EEMEM. Execute a NOP instruction before returning to $\overline{WP}$ high. Tie $\overline{WP}$ to V_{DD}, if not used.
14	$\overline{PR}$	Optional Hardware Override Preset. Refreshes the scratchpad register with current contents of the EEMEM register. Factory default loads midscale 512_{10} until EEMEM is loaded with a new value by the user. $\overline{PR}$ is activated at the logic high transition. Tie $\overline{PR}$ to V_{DD}, if not used.
15	$\overline{CS}$	Serial Register Chip Select Active Low. Serial register operation takes place when $\overline{CS}$ returns to logic high.
16	RDY	Ready. Active high open-drain output. Identifies completion of Instruction 2, Instruction 3, Instruction 8, Instruction 9, Instruction 10, and $\overline{PR}$.
