## : ©hipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation, and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## FEATURES

Converts preset standard input frequencies to standard output frequencies
Input frequencies from $\mathbf{8} \mathbf{~ k H z}$ to $\mathbf{2 0 0} \mathbf{~ M H z}$
Output frequencies up to $\mathbf{8 1 0} \mathbf{~ M H z}$ LVPECL and LVDS ( 200 MHz CMOS)
Preset pin-programmable frequency translation ratios
On-chip VCO
Single-ended CMOS reference input
Two output clocks (independently programmable as LVDS, LVPECL, or CMOS)
Single supply ( 3.3 V)
Very low power: $<450 \mathrm{~mW}$ (under most conditions)
Small package size ( $5 \mathrm{~mm} \times 5 \mathrm{~mm}$ )
Exceeds Telcordia GR-253-CORE jitter generation, transfer and tolerance specifications

## APPLICATIONS

Cost effective replacement of high frequency VCXO, OCXO, and SAW resonators
Flexible frequency translation for wireline applications such as Ethernet, T1/E1, SONET/SDH, GPON, xDSL

## Wireless infrastructure

Test and measurement (including handheld devices)

## GENERAL DESCRIPTION

The AD9550 is a phase-locked loop (PLL) based clock translator designed to address the needs of wireline communication and base station applications. The device employs an integer-N PLL to accommodate the applicable frequency translation requirements. It accepts a single-ended input reference signal at the REF input.

The AD9550 is pin programmable, providing a matrix of standard input/output frequency translations from a list of

Figure 1.

15 possible input frequencies to a list of 52 possible output frequency pairs (OUT1 and OUT2).

The AD9550 output is compatible with LVPECL, LVDS, or single-ended CMOS logic levels, although the AD9550 is implemented in a strictly CMOS process.
The AD9550 operates over the extended industrial temperature range of $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

## REVISION HISTORY

## 8/10-Revision 0: Initial Version

## SPECIFICATIONS

Minimum (min) and maximum (max) values apply for the full range of supply voltage and operating temperature variations. Typical (typ) values apply for $\mathrm{VDD}=3.3 \mathrm{~V} ; \mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, unless otherwise noted.

Table 1.

| Parameter | Min | Typ | Max | Unit | Test Conditions/Comments |
| :---: | :---: | :---: | :---: | :---: | :---: |
| SUPPLY VOLTAGE | 3.135 | 3.30 | 3.465 | V | Pin 18, Pin 21, and Pin 28 |
| POWER CONSUMPTION |  |  |  |  | Tested with both output channels active at maximum output frequency; LVPECL and LVDS outputs use a $100 \Omega$ termination between both pins of the output driver |
| Total Current |  | 162 | 185 | mA |  |
| VDD Current By Pin |  |  |  |  |  |
| Pin 18 |  | 93 | 106 | mA |  |
| Pin 21 |  |  |  |  |  |
| LVDS Configured Output |  | 35 | 41 | mA |  |
| LVPECL Configured Output |  | 36 | 42 | mA |  |
| CMOS Configured Output |  | 29 | 34 | mA |  |
| Pin 28 |  |  |  |  |  |
| LVDS Configured Output |  | 35 | 41 | mA |  |
| LVPECL Configured Output |  | 36 | 42 | mA |  |
| CMOS Configured Output |  | 29 | 34 | mA |  |
| LOGIC INPUT PINS |  |  |  |  |  |
| Input Characteristics ${ }^{1}$ |  |  |  |  |  |
| Logic 1 Voltage, $\mathrm{V}_{\mathrm{IH}}$ | 1.02 |  |  | V | For the CMOS inputs, a static Logic 1 results from either a pull-up resistor or no connection |
| Logic 0 Voltage, $\mathrm{V}_{\text {IL }}$ |  |  | 0.64 | V |  |
| Logic 1 Current, $\mathrm{I}_{\text {H }}$ |  |  | 3 | $\mu \mathrm{A}$ |  |
| Logic 0 Current, $\mathrm{I}_{\text {L }}$ |  |  | 17 | $\mu \mathrm{A}$ |  |
| LOGIC OUTPUT PINS |  |  |  |  |  |
| Output Characteristics |  |  |  |  | Tested at 1 mA load current |
| Output Voltage High, $\mathrm{V}_{\mathrm{OH}}$ | 2.7 |  |  | V |  |
| Output Voltage Low, $\mathrm{V}_{\text {OL }}$ |  |  | 0.19 | V |  |
| $\overline{\text { RESET Pin }}$ |  |  |  |  |  |
| Input Characteristics ${ }^{2}$ |  |  |  |  |  |
| Input Voltage High, $\mathrm{V}_{\mathrm{IH}}$ | 1.96 |  |  | V |  |
| Input Voltage Low, $\mathrm{V}_{\mathrm{IL}}$ |  |  | 0.85 | V |  |
| Input Current High, $\mathrm{I}_{\mathrm{NH}}$ |  | 0.3 | 12.5 | $\mu \mathrm{A}$ |  |
| Input Current Low, $\mathrm{I}_{\text {INL }}$ |  | 31 | 43 | $\mu \mathrm{A}$ |  |
| Minimum Pulse Width Low | 150 |  |  | $\mu \mathrm{s}$ | Tested with an active source driving the $\overline{\text { RESET }}$ pin |
| REFERENCE CLOCK INPUT CHARAC |  |  |  |  |  |
| CMOS Single-Ended Input |  |  |  |  |  |
| Input Frequency Range | 0.008 |  | 200 | MHz |  |
| Input High Voltage | 1.62 |  |  | V |  |
| Input Low Voltage |  |  | 0.52 | V |  |
| Input Threshold Voltage |  | 1.0 |  | V | When ac coupling to the input receiver, the user must dc bias the input to 1 V |
| Input High Current |  | 0.04 |  | $\mu \mathrm{A}$ |  |
| Input Low Current |  | 0.03 |  | $\mu \mathrm{A}$ |  |
| Input Capacitance |  | 3 |  | pF |  |
| Duty Cycle |  |  |  |  | Pulse width high and pulse width low establish the bounds for duty cycle |
| Pulse Width Low | 2 |  |  | ns |  |
| Pulse Width High | 2 |  |  | ns |  |

## AD9550

| Parameter | Min | Typ | Max | Unit | Test Conditions/Comments |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\times 2$ Frequency Multiplier |  |  | 125 | MHz | To avoid excessive reference spurs, the $\times 2$ multiplier requires $48 \%$ to $52 \%$ duty cycle; reference clock input frequencies greater than 125 MHz require the use of the divide-by-5 prescaler |
| VCO CHARACTERISTICS |  |  |  |  |  |
| Frequency Range | 3350 |  | 4050 | MHz |  |
| VCO Gain |  | 45 |  | MHz/V |  |
| VCO Tracking Range | $\pm 300$ |  |  | ppm |  |
| PLL Lock Time |  |  |  |  | Using the pin selected frequency settings; lock time is from the rising edge of the RESET pin to the rising edge of the LOCKED pin |
| Low Bandwidth Setting (170 Hz) |  |  |  |  | Applies for Pin A3 to Pin A0 = 0001 to 1100, or for Pin A3 to $\operatorname{Pin} \mathrm{A} 0=1111$ |
| 13.3 kHz PFD Frequency |  | 214 |  | ms |  |
| 16 kHz PFD Frequency |  | 176 |  | ms |  |
| Medium Bandwidth Setting (20 kHz) |  |  |  |  | Applies for Pin A3 to Pin A0 $=1110$ and $\operatorname{Pin} \mathrm{Y} 5$ to $\mathrm{Pin} \mathrm{YO}=$ 111111 |
| 1.5625 MHz PFD Frequency |  | 2 |  | ms |  |
| High Bandwidth Setting ( 75 kHz ) |  |  |  |  | Applies for Pin A3 to Pin A0 = 1101 to 1110 |
| 2.64 MHz PFD Frequency |  | 1.50 |  | ms |  |
| 4.86 MHz PFD Frequency |  | 0.89 |  | ms |  |

${ }^{1}$ The A 3 to A 0 and Y 5 to Y 0 pins have $100 \mathrm{k} \Omega$ internal pull-up resistors. The OM 2 to OM 0 pins have $40 \mathrm{k} \Omega$ pull-up resistors.
${ }^{2}$ The $\overline{\text { RESET }}$ pin has a $100 \mathrm{k} \Omega$ internal pull-up resistor.

## OUTPUT CHARACTERISTICS

Table 2.

| Parameter | Min | Typ | Max | Unit | Test Conditions/Comments |
| :---: | :---: | :---: | :---: | :---: | :---: |
| LVPECL MODE |  |  |  |  |  |
| Differential Output Voltage Swing | 690 | 800 | 890 | mV | Output driver static (for dynamic performance see Figure 15) |
| Common-Mode Output Voltage | VDD - 1.66 | VDD - 1.34 | VDD-1.01 | V | Output driver static |
| Frequency Range | 0 |  | 810 | MHz |  |
| Duty Cycle | 40 |  | 60 | \% | Up to 805 MHz output frequency |
| Rise/Fall Time ${ }^{1}$ (20\% to 80\%) |  | 255 | 305 | ps | $100 \Omega$ termination between both pins of the output driver |
| LVDS MODE |  |  |  |  |  |
| Differential Output Voltage Swing |  |  |  |  | Output driver static (for dynamic performance see Figure 15) |
| Balanced, $\mathrm{V}_{\text {OD }}$ | 297 |  | 398 | mV | Voltage swing between output pins; output driver static |
| Unbalanced, $\Delta \mathrm{V}_{\mathrm{OD}}$ |  |  | 8.3 | mV | Absolute difference between voltage swing of normal pin and inverted pin; output driver static |
| Offset Voltage |  |  |  |  |  |
| Common Mode, $\mathrm{V}_{\text {os }}$ | 1.17 |  | 1.35 | V | Output driver static |
| Common-Mode Difference, $\Delta y_{s}$ |  |  | 7.3 | mV | Voltage difference between output pins; output driver static |
| Short-Circuit Output Current |  | 17 | 24 | mA |  |
| Frequency Range | 0 |  | 810 | MHz |  |
| Duty Cycle | 40 |  | 60 | \% | Up to 805 MHz output frequency |
| Rise/Fall Time ${ }^{1}$ (20\% to 80\%) |  | 285 | 355 | ps | $100 \Omega$ termination between both pins of the output driver |

| Parameter | Min | Typ | Max | Unit | Test Conditions/Comments |
| :---: | :---: | :---: | :---: | :---: | :---: |
| CMOS MODE |  |  |  |  |  |
| Output Voltage High, $\mathrm{V}_{\text {OH }}$ |  |  |  |  | Output driver static |
| $\mathrm{I}_{\mathrm{OH}}=10 \mathrm{~mA}$ | 2.8 |  |  | V |  |
| $\mathrm{I}_{\mathrm{OH}}=1 \mathrm{~mA}$ | 2.8 |  |  | V |  |
| Output Voltage Low, $\mathrm{V}_{\text {OL }}$ |  |  |  |  | Output driver static |
| $\mathrm{I}_{\mathrm{OL}}=10 \mathrm{~mA}$ |  |  | 0.5 | V |  |
| $\mathrm{I}_{\mathrm{OL}}=1 \mathrm{~mA}$ |  |  | 0.3 | V |  |
| Frequency Range | 0 |  | 200 | MHz | 3.3 V CMOS; output toggle rates in excess of the maximum are possible, but with reduced amplitude (see Figure 14) |
| Duty Cycle | 45 |  | 55 | \% | At maximum output frequency |
| Rise/Fall Time ${ }^{1}$ (20\% to 80\%) |  | 500 | 745 | ps | 3.3 V CMOS; 10 pF load |

${ }^{1}$ The listed values are for the slower edge (rise or fall).

## JITTER CHARACTERISTICS

Table 3.

| Parameter | Min | Typ | Max | Unit | Test Conditions/Comments |
| :---: | :---: | :---: | :---: | :---: | :---: |
| JITTER GENERATION |  |  |  |  |  |

## AD9550

## ABSOLUTE MAXIMUM RATINGS

Table 4.

| Parameter | Rating |
| :--- | :--- |
| Supply Voltage (VDD) | 3.6 V |
| Maximum Digital Input Voltage | -0.5 V to VDD +0.5 V |
| Storage Temperature Range | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Operating Temperature Range | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| Lead Temperature (Soldering, 10 sec ) | $300^{\circ} \mathrm{C}$ |
| Junction Temperature | $150^{\circ} \mathrm{C}$ |

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ESD CAUTION

|  | ESD (electrostatic discharge) sensitive device. <br> Charged devices and circuit boards can discharge <br> without detection. Although this product features <br> patented or proprietary protection circuitry, damage <br> may occur on devices subjected to high energy ESD. <br> Therefore, proper ESD precautions should be taken to <br> avoid performance degradation or loss of functionality. |
| :--- | :--- |

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

| NOTES |
| :--- |
| 1. NC = NO CONNECT. |
| 2. EXPOSED DIE PAD MUST BE CONNECTED TO GND. |
| 啇 |
| 0 |

Figure 2. Pin Configuration
Table 5. Pin Function Descriptions

| Pin No. | Mnemonic | Type ${ }^{1}$ | Description |
| :---: | :---: | :---: | :---: |
| $\begin{aligned} & 29,30,31, \\ & 32,1,2 \end{aligned}$ | $\begin{aligned} & \hline \mathrm{Y} 0, \mathrm{Y} 1, \mathrm{Y} 2, \mathrm{Y} 3, \\ & \mathrm{Y} 4, \mathrm{Y} 5 \end{aligned}$ | I | Control Pins. These pins select one of 52 preset output frequency combinations for OUT1 and OUT2. Each pin has an internal $100 \mathrm{k} \Omega$ pull-up resistor. |
| 3,4,5,6 | A0, A1, A2, A3 | I | Control Pins. These pins select one of 15 preset input reference frequencies. Each pin has an internal $100 \mathrm{k} \Omega$ pull-up resistor. |
| 7 | REF | I | Reference Clock Input. Connect this pin to a single-ended active clock input signal. |
| 8, 11, 24, 25 | GND | P | Ground. |
| 9, 10 | NC |  | No Connection. Make no external connection to these pins. Do not connect to GND or VDD. |
| 12, 13, 14 | $\begin{aligned} & \text { OM2, OM1, } \\ & \text { OM0 } \end{aligned}$ | I | Control Pins. These pins select one of eight preset output configurations (see Table 10). Each pin has an internal $40 \mathrm{k} \Omega$ pull-up resistor. |
| 15 | $\overline{\text { RESET }}$ | I | Reset Internal Logic. This is a digital input pin. This pin is active low with a $100 \mathrm{k} \Omega$ internal pull-up resistor and resets the internal logic to default states (see the Automatic Power-On Reset section). |
| 16 | FILTER | I/O | Loop Filter Node for the PLL. Connect external loop filter components (see Figure 24) from this pin to Pin 17 (LDO). |
| 17, 19 | LDO | P/O | LDO Decoupling Pins. Connect a $0.47 \mu \mathrm{~F}$ decoupling capacitor from each of these pins to ground. |
| 18, 21, 28 | VDD | P | Power Supply Connection: 3.3 V Supply. Pin 21 supplies the OUT2 driver and Pin 28 supplies the OUT1 driver. |
| 20 | LOCKED | 0 | Locked Status Indicator for the PLL. Active high. |
| 26, 22 | OUT1, $\overline{\text { OUT2 }}$ | 0 | Complementary Square Wave Clocking Outputs. |
| 27, 23 | OUT1, OUT2 | 0 | Square Wave Clocking Outputs. |
| N/A ${ }^{2}$ | EP |  | Exposed Die Pad. The exposed die pad must be connected to GND. |

## AD9550

## THEORY OF OPERATION

Figure 23. Detailed Block Diagram

## OVERVIEW

The AD9550 accepts one input reference clock, REF. The input clock path includes an optional divide-by-5 prescaler, an optional $\times 2$ frequency multiplier, and a 14 -bit programmable divider ( R ). The output of the R divider drives the input to the PLL.
The PLL translates the R-divider output to a frequency within the operating range of the $\mathrm{VCO}(3.35 \mathrm{GHz}$ to 4.05 GHz$)$ based on the value of the feedback divider $(\mathrm{N})$. The VCO prescaler $\left(\mathrm{P}_{0}\right)$ reduces the VCO output frequency by an integer factor from 5 to 11 , resulting in an intermediate frequency in the range of 305 MHz to 810 MHz . The 10 -bit $\mathrm{P}_{1}$ and $\mathrm{P}_{2}$ dividers can further reduce the $\mathrm{P}_{0}$ output frequency to yield the final output clock frequencies at OUT1 and OUT2, respectively.
Thus, the frequency translation ratio from the reference input to the output depends on the selection of the divide-by- 5 prescalers, the $\times 2$ frequency multipliers, the values of the three R dividers, the N divider, and the $\mathrm{P}_{0}, \mathrm{P}_{1}$, and $\mathrm{P}_{2}$ dividers. These parameters are set automatically via the preconfigured divider settings per the Ax and Yx pins (see the Preset Frequencies section).

## PRESET FREQUENCIES

The frequency selection pins (A3 to A0 and Y5 to Y0) allow the user to hardwire the device for preset input and output frequencies based on the pin logic states (see Figure 23). The pins decode ground or open connections as Logic 0 or Logic 1, respectively.
The A3 to A0 pins allow the user to select one of 15 input reference frequencies as shown in Table 6. The device sets the appropriate divide-by-5 ( $\div 5$ ), multiply-by- $2(\times 2)$, and input divider $(\mathrm{R})$ values based on the logic levels applied to the Ax pins.

The divide-by- $5, \times 2$, and R values cause the PLL input frequency to be either 16 kHz or $40 / 3 \mathrm{kHz}$. There are two exceptions. The first is for A 3 to $\mathrm{A} 0=1101$, which yields a PLL input frequency of $155.52 / 59 \mathrm{MHz}$. The second is for A 3 to $\mathrm{A} 0=1110$, which yields a PLL input frequency of either 1.5625 MHz or 4.86 MHz depending on the Y 5 to Y 0 pins.
The Y 5 to Y 0 pins allow the user to select one of 52 output frequency combinations ( $\mathrm{f}_{\text {oUt1 }}$ and $\mathrm{f}_{\text {OUT2 }}$ ) per Table 7. The device sets the appropriate $P_{0}, P_{1}$, and $P_{2}$ settings based on the logic levels applied to the Yx pins. Note, however, that selecting 101101 through 110010 require A3 to A0 $=1101$ and selecting 110011 requires A 3 to $\mathrm{A} 0=1110$.
The value ( N ) of the PLL feedback divider and the control setting for the charge pump current (CP) depend on a combination of both the Ax and Yx pin settings as shown in Table 8.

Table 6. Pin Configured Input Frequency, Ax Pins

| A3 to A0 | $\mathrm{f}_{\text {REF }}(\mathrm{MHz})$ | Divide-by-51 | $\times 2^{1}$ | R (Decimal) |

${ }^{1}$ PLL feedback divider value (decimal).
${ }^{2}$ Charge pump value (decimal). Multiply by $3.5 \mu \mathrm{~A}$ to yield $\mathrm{I}_{\mathrm{CP}}$.

## DESCRIPTION OF FUNCTIONAL BLOCKS

## Input Frequency Prescaler (Divide-by-5)

The divide-by- 5 prescaler provides the option to reduce the input reference frequency by a factor of five. Note that the prescaler physically precedes the $\times 2$ frequency multiplier. This allows the prescaler to bring a high frequency reference clock down to a frequency that is within the range of the $\times 2$ frequency multiplier.

## Input $\times 2$ Frequency Multiplier

The $\times 2$ frequency multiplier doubles the frequency at its input, thereby taking advantage of a higher frequency at the input to the PLL. This provides greater separation between the frequency generated by the PLL and the modulation spur associated with frequency at the PLL input.

## PLL (PFD, Charge Pump, VCO, Feedback Divider)

The PLL (see Figure 23) consists of a phase/frequency detector (PFD), a partially integrated analog loop filter (see Figure 24), an integrated voltage controlled oscillator (VCO), and a 20 -bit programmable feedback divider. The PLL generates a 3.35 GHz to 4.05 GHz clock signal that is phase-locked to the input reference signal, and its frequency is the phase detector frequency ( $\mathrm{f}_{\text {PFD }}$ ) multiplied by the feedback divider value.
The PFD of the PLL drives a charge pump that increases, decreases, or holds constant the charge stored on the loop filter capacitors (both internal and external). The stored charge results in a voltage that sets the output frequency of the VCO. The feedback loop of the PLL causes the VCO control voltage to vary in such a way as to phase lock the PFD input signals.

The PLL has a VCO with 128 frequency bands spanning a range of 3350 MHz to 4050 MHz ( 3700 MHz nominal). However, the actual operating frequency within a particular band depends on the control voltage that appears on the loop filter capacitor.
The control voltage causes the VCO output frequency to vary linearly within the selected band. This frequency variability allows the control loop of the PLL to synchronize the VCO output signal with the reference signal applied to the PFD. Selection of the VCO frequency band (as well as gain adjustment) occurs automatically as part of the automatic VCO calibration process of the device, which initiates at power-up (or reset). VCO calibration centers the dc operating point of the VCO control signal. During VCO calibration, the output drivers provide a static dc signal.
The feedback divider ( N -divider) sets the frequency multiplication factor of the PLL in integer steps over a 20-bit range. Note that the N -divider has a lower limit of 32 .

## Loop Filter

The charge pump in the PFD delivers current to the loop filter (see Figure 24). The components primarily responsible for the bandwidth of the loop filter are external and connect between Pin 16 and Pin 17.
The internal portion of the loop filter has two configurations: one is for low loop bandwidth applications $(\sim 170 \mathrm{~Hz})$ and the other is for medium ( $\sim 20 \mathrm{kHz}) /$ high $(\sim 75 \mathrm{kHz})$ bandwidth applications. The low loop bandwidth condition applies when the feedback divider value $(\mathrm{N})$ is $2^{14}(16,384)$ or greater. Otherwise, the medium/high loop bandwidth configuration is in effect. The feedback divider value depends on the configuration of the Ax and $Y x$ pins per Table 8.

Figure 24. External Loop Filter
The bandwidth of the loop filter primarily depends on three external components ( $\mathrm{R}, \mathrm{C} 1$, and C 2 ). There are two sets of recommended values for these components corresponding to the low and medium/high loop bandwidth configurations (see Table 9).

Table 9. External Loop Filter Components

| A3 to A0 Pins | R | C1 | C2 | Loop <br> Bandwidth |
| :--- | :--- | :--- | :--- | :--- |
| 0001 to 1100 , and 1111 | $6.8 \mathrm{k} \Omega$ | 47 nF | $1 \mu \mathrm{~F}$ | 0.17 kHz |
| $110^{1}$ | $12 \mathrm{k} \Omega$ | 51 pF | 220 nF | 20 kHz |
| 1101 to 1110 | $12 \mathrm{k} \Omega$ | 51 pF | 220 nF | 75 kHz |

${ }^{1}$ The 20 kHz loop bandwidth case only applies when the A 3 pin to $\mathrm{A} 0 \mathrm{pin}=$ 1110 and the Y 5 pin to $\mathrm{Y} 0 \mathrm{pin}=111111$.

To achieve the best jitter performance in applications requiring a loop bandwidth of less than $1 \mathrm{kHz}, \mathrm{C} 1$ and C 2 must have an insulation resistance of at least $500 \Omega \mathrm{~F}$.

## PLL Locked Indicator

The PLL provides a status indicator that appears at Pin 20 (LOCKED). When the PLL acquires phase lock, the LOCKED pin switches to a Logic 1 state. When the PLL loses lock, however, the LOCKED pin returns to a Logic 0 state.

## AD9550

## Output Dividers

The output divider section consists of three dividers: $\mathrm{P}_{0}, \mathrm{P}_{1}$, and $\mathrm{P}_{2}$. The $\mathrm{P}_{0}$ divider (or VCO frequency prescaler) accepts the VCO frequency and reduces it by an integer factor of 5 to 11 , thereby reducing the frequency to a range between 305 MHz and 810 MHz .
The output of the $\mathrm{P}_{0}$ divider independently drives the $\mathrm{P}_{1}$ divider and the $P_{2}$ divider. The $P_{1}$ divider establishes the frequency at OUT1 and the $P_{2}$ divider establishes the frequency at OUT2. The $P_{1}$ and $P_{2}$ dividers are each programmable over a range of 1 to 1023 , which results in a frequency at OUT1 or OUT2 that is an integer submultiple of the frequency at the output of the $\mathrm{P}_{0}$ divider.

## Output Driver Mode Control

Three mode control pins (OM0, OM1, and OM2) establish the logic family and pin function of the output drivers. The logic families include LVDS, LVPECL, and CMOS (see Table 10).

Table 10. Logic Family Assignment via the OMx Pins

| Pin OMx | Logic Family |  |
| :--- | :--- | :--- |
|  | OUT1 | OUT2 |
| 000 | LVPECL | LVPECL |
| 001 | LVPECL | LVDS |
| 010 | LVDS | LVPECL |
| 011 | LVPECL | CMOS |
| 100 | LVDS | LVDS |
| 101 | LVDS | CMOS |
| 110 | CMOS | LVDS |
| 111 | CMOS | CMOS |

Because both output drivers support the LVDS and LVPECL logic families, each driver has two pins to handle the differential signals associated with these two logic families. The OUT1 driver uses the OUT1 and $\overline{\text { OUT1 }}$ pins, and the OUT2 driver uses the OUT2 and $\overline{\text { OUT2 }}$ pins. When the OMx pins select the CMOS logic family, the signal at the $\overline{\mathrm{OUT} 1} \mathrm{pin}$ is a phase aligned replica of the signal at the OUT1 pin and the signal at the $\overline{\text { OUT2 }}$ pin is a phase aligned replica of the signal at the OUT2 pin.

## JITTER TOLERANCE

Jitter tolerance is the ability of the AD9550 to maintain lock in the presence of sinusoidal jitter. The AD9550 meets the input jitter tolerance mask per Telcordia GR-253-CORE (see Figure 25). The acceptable jitter tolerance is the region above the mask.

Figure 25. Jitter Tolerance

## LOW DROPOUT (LDO) REGULATORS

The AD9550 is powered from a single 3.3 V supply and contains on-chip LDO regulators for each function to eliminate the need for external LDOs. To ensure optimal performance, each LDO output should have a $0.47 \mu \mathrm{~F}$ capacitor connected between its access pin and ground.

## AUTOMATIC POWER-ON RESET

The AD9550 has an internal power-on reset circuit (see Figure 26). At power-up, an 800 pF capacitor momentarily holds a Logic 0 at the active low input of the reset circuitry. This ensures that the device is held in a reset state ( $\sim 250 \mu \mathrm{~s}$ ) until the capacitor charges sufficiently via the $100 \mathrm{k} \Omega$ pull-up resistor and $200 \mathrm{k} \Omega$ series resistor. Note that when using a low impedance source to drive the RESET pin, be sure that the source is either tristate or Logic 0 at power-up; otherwise, the device may not calibrate properly.

Figure 26. Power-On Reset
Provided an input reference signal is present at the REF pin, the device automatically performs a VCO calibration during power-up. If the input reference signal is not present, VCO calibration fails and the PLL does not lock. As soon as an input reference signal is present, the user must reset the device to initiate the automatic VCO calibration process.

Any change to the preset frequency selection pins requires the user to reset the device. This is necessary to initiate the automatic VCO calibration process.

## APPLICATIONS INFORMATION

## THERMAL PERFORMANCE

The AD9550 is specified for case temperature ( $\mathrm{T}_{\text {CASE }}$ ). To ensure that $\mathrm{T}_{\text {CASE }}$ is not exceeded, use an airflow source.
The following equation determines the junction temperature on the application printed circuit board (PCB):

$$
T_{J}=T_{C A S E}+\left(\Psi_{J T} \times P_{D}\right)
$$

where:
$T_{J}$ is the junction temperature ( ${ }^{\circ} \mathrm{C}$ ).
$T_{\text {CASE }}$ is the case temperature $\left({ }^{\circ} \mathrm{C}\right)$ measured by the customer at the top center of the package.
$\Psi_{J T}$ is the value indicated in Table 11.
$P_{D}$ is the power dissipation (see Table 1 for the power consumption parameters).
Values of $\theta_{\mathrm{A}}$ are provided for package comparison and PCB design considerations. $\theta_{\text {JA }}$ can be used for a first-order approximation of $\mathrm{T}_{\mathrm{J}}$ using the following equation:

$$
T_{J}=T_{A}+\left(\theta_{J A} \times P_{D}\right)
$$

where $T_{A}$ is the ambient temperature $\left({ }^{\circ} \mathrm{C}\right)$.
Values of $\theta_{\mathrm{IC}}$ are provided for package comparison and PCB design considerations when an external heat sink is required.
Values of $\theta_{\mathrm{IB}}$ are provided for package comparison and PCB design considerations.

Table 11. Thermal Parameters for the 32-Lead LFCSP

| Symbol | Description | Value ${ }^{1}$ | Unit |
| :---: | :---: | :---: | :---: |
| $\theta_{\text {JA }}$ | Junction-to-ambient thermal resistance, $0 \mathrm{~m} / \mathrm{sec}$ airflow per JEDEC JESD51-2 (still air) | 41.6 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\theta_{\text {JMA }}$ | Junction-to-ambient thermal resistance, $1.0 \mathrm{~m} / \mathrm{sec}$ airflow per JEDEC JESD51-6 (moving air) | 36.4 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\theta_{\text {JMA }}$ | Junction-to-ambient thermal resistance, $2.5 \mathrm{~m} / \mathrm{sec}$ airflow per JEDEC JESD51-6 (moving air) | 32.6 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\theta_{\text {JB }}$ | Junction-to-board thermal resistance, $0 \mathrm{~m} / \mathrm{sec}$ airflow per JEDEC JESD51-8 (still air) | 24.2 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\Psi_{\text {J }}$ | Junction-to-board characterization parameter, $0 \mathrm{~m} / \mathrm{sec}$ airflow per JEDEC JESD51-6 (still air) | 22.9 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\theta_{\text {Jc }}$ | Junction-to-case thermal resistance | 4.8 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\psi_{\text {JT }}$ | Junction-to-top-of-package characterization parameter, $0 \mathrm{~m} / \mathrm{sec}$ airflow per JEDEC JESD51-2 (still air) | 0.5 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

${ }^{1}$ Results are from simulations. The PCB is a JEDEC multilayer type. Thermal performance for actual applications requires careful inspection of the conditions in the application to determine whether they are similar to those assumed in these calculations.
