

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

**FEATURES**

**PLL generated or direct master clock**  
**Low EMI design**  
**108 dB DAC/107 dB ADC dynamic range and SNR**  
**-94 dB THD + N**  
**Single 3.3 V supply**  
**Tolerance for 5 V logic inputs**  
**Supports 24 bits and 8 kHz to 192 kHz sample rates**  
**Differential ADC input**  
**Single-ended DAC output**  
**Log volume control with autoramp function**  
**SPI® controllable for flexibility**  
**Software controllable clickless mute**  
**Software power-down**  
**Right justified, left justified, I<sup>2</sup>S and TDM modes**  
**Master and slave modes up to 16-channel in/out**  
**48-lead LQFP**

**APPLICATIONS**

**Home theater systems**  
**Set-top boxes**  
**Digital audio effects processors**

**GENERAL DESCRIPTION**

The ADAU1328 is a high performance, single-chip codec that provides two analog-to-digital converters (ADCs) with differential input and eight digital-to-analog converters (DACs) with single-ended output using the Analog Devices, Inc. patented multibit sigma-delta ( $\Sigma$ - $\Delta$ ) architecture. An SPI port is included, allowing a microcontroller to adjust volume and many other parameters. The ADAU1328 operates from 3.3 V digital and analog supplies. The ADAU1328 is available in a 48-lead (single-ended output) LQFP. Other members of this family include a differential DAC output version.

The ADAU1328 is designed for low EMI. This consideration is apparent in both the system and circuit design architectures. By using the on-board PLL to derive the master clock from the LR clock or from an external crystal, the ADAU1328 eliminates the need for a separate high frequency master clock and can also be used with a suppressed bit clock. The digital-to-analog and analog-to-digital converters are designed using the latest ADI continuous time architectures to further minimize EMI. By using 3.3 V supplies, power consumption is minimized, further reducing emissions.

## SPECIFICATIONS

### TEST CONDITIONS

Performance of all channels is identical, exclusive of the interchannel gain mismatch and interchannel phase deviation specifications.

Supply Voltages (AVDD, DVDD)	3.3 V
Temperature Range <sup>1</sup>	As specified in Table 1
Master Clock	12.288 MHz (48 kHz $f_s$ , 256 × $f_s$ mode)
Input Sample Rate	48 kHz
Measurement Bandwidth	20 Hz to 20 kHz
Word Width	24 bits
Load Capacitance (Digital Output)	20 pF
Load Current (Digital Output)	±1 mA or 1.5 kΩ to ½ DVDD supply
Input Voltage HI	2.0 V
Input Voltage LO	0.8 V

<sup>1</sup> Functionally guaranteed at –40°C to +85°C case temperature.

### ANALOG PERFORMANCE SPECIFICATIONS

Specifications guaranteed at 25°C (ambient).

## ABSOLUTE MAXIMUM RATINGS

Table 7.

Parameter	Rating
Analog (AVDD)	-0.3 V to +3.6 V
Digital (DVDD)	-0.3 V to +3.6 V
Input Current (Except Supply Pins)	±20 mA
Analog Input Voltage (Signal Pins)	-0.3 V to AVDD + 0.3 V
Digital Input Voltage (Signal Pins)	-0.3 V to DVDD + 0.3 V
Operating Temperature Range (Case)	-40°C to +85°C
Storage Temperature Range	-65°C to +150°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## THERMAL RESISTANCE

$\theta_{JA}$  represents thermal resistance, junction-to-ambient;  $\theta_{JC}$  represents the thermal resistance, junction-to-case. All characteristics are for a 4-layer board.

Table 8. Thermal Resistance

Package Type	$\theta_{JA}$	$\theta_{JC}$	Unit
48-Lead LQFP	50.1	17	°C/W

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

## THEORY OF OPERATION

### ANALOG-TO-DIGITAL CONVERTERS (ADCs)

There are two ADC channels in the ADAU1328 configured as two stereo pairs with differential inputs. The ADCs can operate at a nominal sample rate of 48 kHz, 96 kHz, or 192 kHz. The ADCs include on-board digital antialiasing filters with 79 dB stop-band attenuation and linear phase response, operating at an oversampling ratio of 128 (48 kHz, 96 kHz, and 192 kHz modes). Digital outputs are supplied through two serial data output pins (one for each stereo pair) and a common frame (ALRCLK) and bit (ABCLK) clock. Alternatively, one of the TDM modes can be used to access up to 16 channels on a single TDM data line.

The ADCs must be driven from a differential signal source for best performance. The input pins of the ADCs connect to internal switched capacitors. To isolate the external driving op amp from the glitches caused by the internal switched capacitors, each input pin should be isolated by using a series connected, external, 100  $\Omega$  resistor together with a 1 nF capacitor connected from each input to ground. This capacitor must be of high quality, for example, ceramic NPO or polypropylene film.

The differential inputs have a nominal common-mode voltage of 1.5 V. The voltage at the common-mode reference pin (CM) can be used to bias external op amps to buffer the input signals (see the Power Supply and Voltage Reference section). The inputs can also be ac-coupled and do not need an external dc bias to CM.

A digital high-pass filter can be switched in line with the ADCs under serial control to remove residual dc offsets. It has a 1.4 Hz, 6 dB per octave cutoff at a 48 kHz sample rate. The cutoff frequency scales directly with sample frequency.

### DIGITAL-TO-ANALOG CONVERTERS (DACs)

The ADAU1328 DAC channels are arranged as single-ended, four stereo pairs giving eight analog outputs for minimum external components. The DACs include on-board digital reconstruction filters with 70 dB stop-band attenuation and linear phase response, operating at an oversampling ratio of 4 (48 kHz or 96 kHz modes) or 2 (192 kHz mode). Each channel has its own independently programmable attenuator, adjustable in 255 steps in increments of 0.375 dB. Digital inputs are supplied through four serial data input pins (one for each stereo pair) and a common frame (DLRCLK) and bit (DBCLK) clock. Alternatively, one of the TDM modes can be used to access up to 16 channels on a single TDM data line.

Each output pin has a nominal common-mode dc level of 1.5 V and swings  $\pm 1.27$  V for a 0 dBFS digital input signal. A single op amp, third-order, external, low-pass filter is recommended to remove high frequency noise present on the output pins. The use of op amps with low slew rate or low bandwidth can cause high frequency noise and tones to fold down into the audio band; therefore, exercise care in selecting these components.

The voltage at CM, the common-mode reference pin, can be used to bias the external op amps that buffer the output signals (see the Power Supply and Voltage Reference section).

### CLOCK SIGNALS

The on-chip phase locked loop (PLL) can be selected to reference the input sample rate from either of the LRCLK pins or 256, 384, 512, or 768 times the sample rate, referenced to the 48 kHz mode from the MCLKI pin. The default at power-up is  $256 \times f_s$  from MCLKI. In 96 kHz mode, the master clock frequency stays at the same absolute frequency; therefore, the actual multiplication rate is divided by 2. In 192 kHz mode, the actual multiplication rate is divided by 4. For example, if a device in the ADAU1328 family is programmed in  $256 \times f_s$  mode, the frequency of the master clock input is  $256 \times 48$  kHz = 12.288 MHz. If the ADAU1328 is then switched to 96 kHz operation (by writing to the SPI port), the frequency of the master clock should remain at 12.288 MHz, which is now  $128 \times f_s$ . In 192 kHz mode, this becomes  $64 \times f_s$ .

The internal clock for the ADCs is  $256 \times f_s$  for all clock modes. The internal clock for the DACs varies by mode:  $512 \times f_s$  (48 kHz mode),  $256 \times f_s$  (96 kHz mode), or  $128 \times f_s$  (192 kHz mode). By default, the on-board PLL generates this internal master clock from an external clock. A direct  $512 \times f_s$  (referenced to 48 kHz mode) master clock can be used for either the ADCs or DACs if selected in PLL and Clock Control 1 Register.

Note that it is not possible to use a direct clock for the ADCs set to the 192 kHz mode. It is required that the on-chip PLL be used in this mode.

The PLL can be powered down in PLL and Clock Control 0 Register. To ensure reliable locking when changing PLL modes, or if the reference clock is unstable at power-on, power down the PLL and then power it back up when the reference clock has stabilized.

The internal MCLK can be disabled in PLL and Clock Control 0 Register to reduce power dissipation when the ADAU1328 is idle. The clock should be stable before it is enabled. Unless a standalone mode is selected (see the Serial Control Port section), the clock is disabled by reset and must be enabled by writing to the SPI port for normal operation.

To maintain the highest performance possible, it is recommended that the clock jitter of the internal master clock signal be limited to less than 300 ps rms time interval error (TIE). Even at these levels, extra noise or tones can appear in the DAC outputs if the jitter spectrum contains large spectral peaks. If the internal PLL is not being used, it is highly recommended that an independent crystal oscillator generate the master clock. In addition, it is especially important that the clock signal not be passed through an FPGA, CPLD, or other large digital chip (such as a DSP) before being applied to the ADAU1328. In most cases, this induces clock jitter due to the sharing of common power and ground connections with other unrelated digital output signals. When the PLL is used, jitter in the reference clock is attenuated above a certain frequency depending on the loop filter.

**RESET AND POWER-DOWN**

Reset sets all the control registers to their default settings. To avoid pops, reset does not power down the analog outputs. After reset is deasserted, and the PLL acquires lock condition, an initialization routine runs inside the ADAU1328. This initialization lasts for approximately 256 MCLKs.

The power-down bits in the PLL and Clock Control 0, DAC Control 1, and ADC Control 1 registers power down the respective sections. All other register settings are retained. The reset pin should be pulled low by an external resistor to guarantee proper startup.

**SERIAL CONTROL PORT**

The ADAU1328 has an SPI control port that permits programming and reading back of the internal control registers for the ADCs, DACs, and clock system. A standalone mode is available for operation without serial control, standalone is configured at reset by connecting CIN, CCLK and CLATCH to ground. In standalone mode, all registers are set to default, except the internal MCLK enable which is set to 1. The ADC ABCLK and ALRCLK clock ports are set to master/slave by the connecting the COUT pin to either DVDD or ground. Standalone mode only supports stereo mode with an I<sup>2</sup>S data format and 256 f<sub>s</sub> MCLK rate. Refer to Table 10 for details. If CIN, CCLK, and CLATCH are not grounded, the ADAU1328 SPI port is active. It is recommended to use a weak pull-up resistor on CLATCH in applications that have a microcontroller. This pull-up resistor ensures that the ADAU1328 recognizes the presence of a microcontroller.

The SPI control port of the ADAU1328 is a 4-wire serial control port. The format is similar to the Motorola SPI format except the input data-word is 24 bits wide. The serial bit clock and latch can be completely asynchronous to the sample rate of the ADCs and DACs. Figure 11 shows the format of the SPI signal. The first byte is a global address with a read/write bit. For the ADAU1328, the address is 0x04, shifted left 1 bit due to the R/W bit. The second byte is the ADAU1328 register address and the third byte is the data.

**Table 10. Standalone Mode Selection**

ADC Clocks	CIN/ADRO	COUT/SDA	CCLK/SCL	CLATCH/ADR1
Slave	0	0	0	0
Master	0	1	0	0

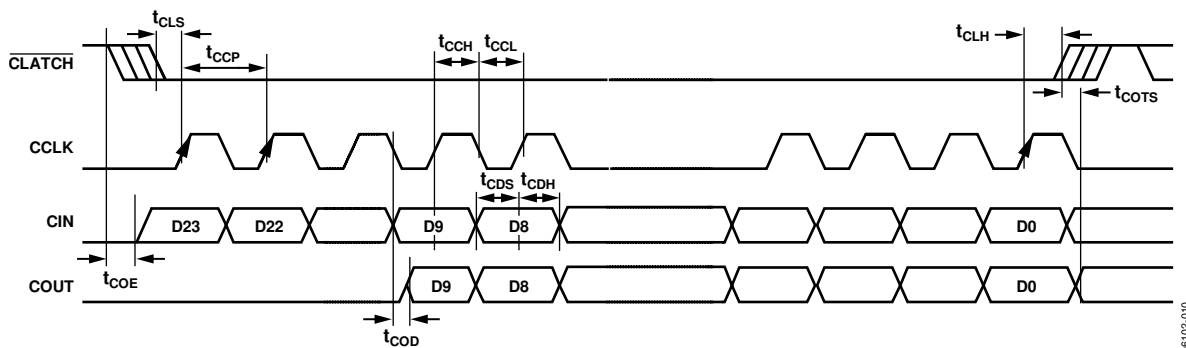

Figure 11. Format of SPI Signal

**POWER SUPPLY AND VOLTAGE REFERENCE**

The ADAU1328 is designed for 3.3 V supplies. Separate power supply pins are provided for the analog and digital sections. These pins should be bypassed with 100 nF ceramic chip capacitors, as close to the pins as possible, to minimize noise pickup. A bulk aluminum electrolytic capacitor of at least 22  $\mu$ F should also be provided on the same PC board as the codec. For critical applications, improved performance is obtained with separate supplies for the analog and digital sections. If this is not possible, it is recommended that the analog and digital supplies be isolated by means of a ferrite bead in series with each supply. It is important that the analog supply be as clean as possible.

All digital inputs are compatible with TTL and CMOS levels. All outputs are driven from the 3.3 V DVDD supply and are compatible with TTL and 3.3 V CMOS levels.

The ADC and DAC internal voltage reference (VREF) is brought out on FILTR and should be bypassed as close as possible to the chip, with a parallel combination of 10  $\mu$ F and 100 nF. Any external current drawn should be limited to less than 50  $\mu$ A.

The internal reference can be disabled in PLL and Clock Control 1 Register, and FILTR can be driven from an external source. This can be used to scale the DAC output to the clipping level of a power amplifier based on its power supply voltage. The ADC input gain varies by the inverse ratio. The total gain from ADC input to DAC output remains constant.

The CM pin is the internal common-mode reference. It should be bypassed as close as possible to the chip, with a parallel combination of 47  $\mu$ F and 100 nF. This voltage can be used to bias external op amps to the common-mode voltage of the input and output signal pins. The output current should be limited to less than 0.5 mA source and 2 mA sink.

**SERIAL DATA PORTS—DATA FORMAT**

The eight DAC channels use a common serial bit clock (DBCLK) and a common left-right framing clock (DLRCLK) in the serial data port. The four ADC channels use a common serial bit clock (ABCLK) and left-right framing clock (ALRCLK) in the serial data port. The clock signals are all synchronous with the sample rate. The normal stereo serial modes are shown in Figure 23.

The ADC and DAC serial data modes default to I<sup>2</sup>S. The ports can also be programmed for left justified, right justified, and TDM modes. The word width is 24 bits by default and can be programmed for 16 or 20 bits. The DAC serial formats are programmable according to DAC Control 0 Register. The polarity of the DBCLK and DLRCLK is programmable according to DAC Control 1 Register. The ADC serial formats and serial clock polarity are programmable according to ADC Control 1 Register. Both DAC and ADC serial ports are programmable to become the bus masters according to DAC Control 1 Register and Control 2 Register. By default, both ADC and DAC serial ports are in the slave mode.

**TIME-DIVISION MULTIPLEXED (TDM) MODES**

The ADAU1328 serial ports also have several different TDM serial data modes. The first and most commonly used configurations are shown in Figure 12 and Figure 13. In Figure 12, the ADC serial port outputs one data stream consisting of four on-chip ADCs followed by four unused slots. In Figure 13, the eight on-chip DAC data slots are packed into one TDM stream. In this mode, both DBCLK and ABCLK are 256 f<sub>s</sub>.

The I/O pins of the serial ports are defined according to the serial mode selected. For a detailed description of the function of each pin in TDM and AUX modes, see Table 11.

The ADAU1328 allows systems with more than eight DAC channels to be easily configured by the use of an auxiliary serial data port. The DAC TDM-AUX mode is shown in Figure 14. In this mode, the AUX channels are the last four slots of the TDM data stream. These slots are extracted and output to the AUX serial port. It should be noted that due to the high DBCLK frequency, this mode is available only in the 48 kHz/44.1 kHz/32 kHz sample rate.

The ADAU1328 also allows system configurations with more than four ADC channels, as shown in Figure 15 and Figure 16, which show using 8 ADCs and 16 ADCs, respectively. Again, due to the high ABCLK frequency, this mode is available only in the 48 kHz/44.1 kHz/32 kHz sample rate.

Combining the AUX DAC and ADC modes results in a system configuration of 8 ADCs and 12 DACs. The system, then, consists of two external stereo ADCs, two external stereo DACs, and one ADAU1328. This mode is shown in Figure 17 (combined AUX DAC and ADC modes).

**DAISY-CHAIN MODE**

The ADAU1328 also allows a daisy-chain configuration to expand the system to 8 ADCs and 16 DACs (see Figure 18). In this mode, the DBCLK frequency is 512 fs. The first eight slots of the DAC TDM data stream belong to the first ADAU1328 in the chain and the last eight slots belong to the second ADAU1328. The second ADAU1328 is the device attached to the DSP TDM port.

To accommodate 16 channels at a 96 kHz sample rate, the ADAU1328 can be configured into a dual-line, DAC TDM mode, as shown in Figure 19. This mode allows a slower DBCLK than normally required by the one-line TDM mode.

Again, the first four channels of each TDM input belong to the first ADAU1328 in the chain and the last four channels belong to the second ADAU1328.

The dual-line TDM mode can also be used to send data at a 192 kHz sample rate into the ADAU1328, as shown in Figure 20. There are two configurations for the ADC port to work in daisy-chain mode. The first one is with an ABCLK at 256 fs shown in Figure 21. The second configuration is shown in Figure 22. Note that in the 512 fs ABCLK mode, the ADC channels occupy the first eight slots; the second eight slots are empty. The TDM\_IN of the first ADAU1328 must be grounded in all modes of operation.

The I/O pins of the serial ports are defined according to the serial mode selected. See Table 12 for a detailed description of the function of each pin. See Figure 26 for a typical ADAU1328 configuration with two external stereo DACs and two external stereo ADCs.

Figure 23 through Figure 25 show the serial mode formats. For maximum flexibility, the polarity of LRCLK and BCLK are programmable. In these figures, all of the clocks are shown with their normal polarity. The default mode is I<sup>2</sup>S.

NOTES

1. DSP MODE DOES NOT IDENTIFY CHANNEL.
2. LRCLK NORMALLY OPERATES AT  $f_s$  EXCEPT FOR DSP MODE, WHICH IS  $2 \times f_s$ .
3. BCLK FREQUENCY IS NORMALLY  $64 \times$  LRCLK BUT MAY BE OPERATED IN BURST MODE.

## CONTROL REGISTERS

### DEFINITIONS

The global address for the ADAU1328 is 0x04, shifted left 1 bit due to the  $\overline{R/W}$  bit. All registers are reset to 0, except for the DAC volume registers that are set to full volume.

Note that the first setting in each control register parameter is the default setting.

**Table 13. Register Format**

	Global Address	R/W	Register Address	Data
Bit	23:17	16	15:8	7:0

**Table 14. Register Addresses and Functions**

Address	Function
0	PLL and Clock Control 0
1	PLL and Clock Control 1
2	DAC Control 0
3	DAC Control 1
