

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# ADC1410S series

Single 14-bit ADC; 65 Msps, 80 Msps, 105 Msps or 125 Msps;  
CMOS or LVDS DDR digital outputs

Rev. 05 — 2 July 2012

Product data sheet

## 1. General description

---

The ADC1410S is a single-channel 14-bit Analog-to-Digital Converter (ADC) optimized for high dynamic performance and low power consumption at sample rates up to 125 Msps. Pipelined architecture and output error correction ensure the ADC1410S is accurate enough to guarantee zero missing codes over the entire operating range. Supplied from a single 3 V source, it can handle output logic levels from 1.8 V to 3.3 V in CMOS mode, because of a separate digital output supply. It supports the Low Voltage Differential Signalling (LVDS) Double Data Rate (DDR) output standard. An integrated Serial Peripheral Interface (SPI) allows the user to easily configure the ADC. The device also includes a programmable full-scale SPI to allow a flexible input voltage range from 1 V to 2 V (peak-to-peak). With excellent dynamic performance from the baseband to input frequencies of 170 MHz or more, the ADC1410S is ideal for use in communications, imaging and medical applications.

## 2. Features and benefits

---

- SNR, 72 dBFS; SFDR, 86 dBc
- Sample rate up to 125 Msps
- 14-bit pipelined ADC core
- Clock input divided by 2 for less jitter
- Single 3 V supply
- Flexible input voltage range: 1 V (p-p) to 2 V (p-p)
- Offset binary, two's complement, gray code
- Power-down and Sleep modes
- Input bandwidth, 600 MHz
- Power dissipation, 430 mW at 80 Msps
- Serial Peripheral Interface (SPI)
- Duty cycle stabilizer
- Fast Out of Range (OTR) detection
- CMOS or LVDS DDR digital outputs
- Pin compatible with the ADC1210S series and the ADC1010S series
- HVQFN40 package

## 3. Applications

---

- Wireless and wired broadband communications
- Spectral analysis
- Ultrasound equipment
- Portable instrumentation
- Imaging systems
- Software defined radio

## 4. Ordering information

Table 1. Ordering information

Type number	f <sub>s</sub> (MSPs)	Package		Version
		Name	Description	
ADC1410S125HN-C1	125	HVQFN40	plastic thermal enhanced very thin quad flat package; no leads; 40 terminals; body 6 × 6 × 0.85 mm	SOT618-1
ADC1410S105HN-C1	105	HVQFN40	plastic thermal enhanced very thin quad flat package; no leads; 40 terminals; body 6 × 6 × 0.85 mm	SOT618-1
ADC1410S080HN-C1	80	HVQFN40	plastic thermal enhanced very thin quad flat package; no leads; 40 terminals; body 6 × 6 × 0.85 mm	SOT618-1
ADC1410S065HN-C1	65	HVQFN40	plastic thermal enhanced very thin quad flat package; no leads; 40 terminals; body 6 × 6 × 0.85 mm	SOT618-1

### 6.2 Pin description

Table 2. Pin description (CMOS digital outputs)

Symbol	Pin	Type <sup>[1]</sup>	Description
REFB	1	O	bottom reference
REFT	2	O	top reference
AGND	3	G	analog ground
VCM	4	O	common-mode output voltage
VDDA	5	P	analog power supply
AGND	6	G	analog ground
INM	7	I	complementary analog input
INP	8	I	analog input
AGND	9	G	analog ground
VDDA	10	P	analog power supply
VDDA	11	P	analog power supply
CLKP	12	I	clock input
CLKM	13	I	complementary clock input
DEC	14	O	regulator decoupling node
$\overline{OE}$	15	I	output enable, active LOW
PWD	16	I	power-down, active HIGH

**Table 2. Pin description (CMOS digital outputs) ...continued**

Symbol	Pin	Type <sup>[1]</sup>	Description
D13	17	O	data output bit 13 (Most Significant Bit (MSB))
D12	18	O	data output bit 12
D11	19	O	data output bit 11
D10	20	O	data output bit 10
D9	21	O	data output bit 9
D8	22	O	data output bit 8
D7	23	O	data output bit 7
D6	24	O	data output bit 6
D5	25	O	data output bit 5
D4	26	O	data output bit 4
D3	27	O	data output bit 3
D2	28	O	data output bit 2
D1	29	O	data output bit 1
D0	30	O	data output bit 0 (Least Significant Bit (LSB))
DAV	31	O	data valid output clock
n.c.	32	-	not connected
VDDO	33	P	output power supply
OGND	34	G	output ground
OTR	35	O	out of range
SCLK/DFS	36	I	SPI clock data format select
SDIO/ODS	37	I/O	SPI data IO output data standard
$\overline{\text{CS}}$	38	I	SPI chip select
SENSE	39	I	reference programming pin
VREF	40	I/O	voltage reference input/output

[1] P: power supply; G: ground; I: input; O: output; I/O: input/output.

**Table 3. Pin description (LVDS/DDR) digital outputs)**

Symbol	Pin <sup>[1]</sup>	Type <sup>[2]</sup>	Description
D12_D13_M	17	O	differential output data D12 and D13 multiplexed, complement
D12_D13_P	18	O	differential output data D12 and D13 multiplexed, true
D10_D11_M	19	O	differential output data D10 and D11 multiplexed, complement
D10_D11_P	20	O	differential output data D10 and D11 multiplexed, true
D8_D9_M	21	O	differential output data D8 and D9 multiplexed, complement
D8_D9_P	22	O	differential output data D8 and D9 multiplexed, true
D6_D7_M	23	O	differential output data D6 and D7 multiplexed, complement
D6_D7_P	24	O	differential output data D6 and D7 multiplexed, true
D4_D5_M	25	O	differential output data D4 and D5 multiplexed, complement
D4_D5_P	26	O	differential output data D4 and D5 multiplexed, true
D2_D3_M	27	O	differential output data D2 and D3 multiplexed, complement
D2_D3_P	28	O	differential output data D2 and D3 multiplexed, true
D0_D1_M	29	O	differential output data D0 and D1 multiplexed, complement

**Table 3. Pin description (LVDS/DDR) digital outputs) ...continued**

Symbol	Pin <sup>[1]</sup>	Type <sup>[2]</sup>	Description
D0_D1_P	30	O	differential output data D0 and D1 multiplexed, true
DAVM	31	O	data valid output clock, complement
DAVP	32	O	data valid output clock, true

[1] Pins 1 to 16 and pins 33 to 40 are the same for both CMOS and LVDS DDR outputs (see Table 2).

[2] P: power supply; G: ground; I: input; O: output; I/O: input/output.

## 7. Limiting values

**Table 4. Limiting values**

In accordance with the Absolute Maximum Rating System (IEC 60134).

Symbol	Parameter	Conditions	Min	Max	Unit
V <sub>O</sub>	output voltage	pins D13 to D0 or pins D12_D13_M to D0_D1_M and pins D12_D13_P to D0_D1_P	-0.4	+3.9	V
V <sub>DDA</sub>	analog supply voltage		-0.4	+3.9	V
V <sub>DDO</sub>	output supply voltage		-0.4	+3.9	V
T <sub>stg</sub>	storage temperature		-55	+125	°C
T <sub>amb</sub>	ambient temperature		-40	+85	°C
T <sub>j</sub>	junction temperature		-	125	°C

## 8. Thermal characteristics

**Table 5. Thermal characteristics**

Symbol	Parameter	Conditions	Typ	Unit
R <sub>th(j-a)</sub>	thermal resistance from junction to ambient		<sup>[1]</sup> 22.5	K/W
R <sub>th(j-c)</sub>	thermal resistance from junction to case		<sup>[1]</sup> 11.7	K/W

[1] Value for six layers board in still air with a minimum of 25 thermal vias.

## 9. Static characteristics

Table 6. Static characteristics<sup>[1]</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
<b>Supplies</b>						
V <sub>DDA</sub>	analog supply voltage		2.85	3.0	3.4	V
V <sub>DDO</sub>	output supply voltage	CMOS mode	1.65	1.8	3.6	V
		LVDS DDR mode	2.85	3.0	3.6	V
I <sub>DDA</sub>	analog supply current	f <sub>clk</sub> = 125 Msps; f <sub>i</sub> = 70 MHz	-	210	-	mA
I <sub>DDO</sub>	output supply current	CMOS mode; f <sub>clk</sub> = 125 Msps; f <sub>i</sub> = 70 MHz	-	14	-	mA
		LVDS DDR mode: f <sub>clk</sub> = 125 Msps; f <sub>i</sub> = 70 MHz	-	43	-	mA
P	power dissipation	ADC1410S125; analog supply only	-	630	-	mW
		ADC1410S105; analog supply only	-	550	-	mW
		ADC1410S080; analog supply only	-	430	-	mW
		ADC1410S065; analog supply only	-	380	-	mW
		Power-down mode	-	14	-	mW
		Sleep mode	-	40	-	mW

### Clock inputs: pins CLKP and CLKM

#### Low-Voltage Positive Emitter-Coupled Logic (LVPECL)

V <sub>i(clk)dif</sub>	differential clock input voltage	peak-to-peak	-	1.6	-	V
------------------------	----------------------------------	--------------	---	-----	---	---

#### SINE wave

V <sub>i(clk)dif</sub>	differential clock input voltage	peak	-	±3.0	-	V
------------------------	----------------------------------	------	---	------	---	---

#### Low Voltage Complementary Metal Oxide Semiconductor (LVCMOS)

V <sub>IL</sub>	LOW-level input voltage		-	-	0.3V <sub>DDA</sub>	V
V <sub>IH</sub>	HIGH-level input voltage		0.7V <sub>DDA</sub>	-	-	V

### Logic inputs: pins PWD and OE

V <sub>IL</sub>	LOW-level input voltage		0	-	0.8	V
V <sub>IH</sub>	HIGH-level input voltage		2	-	V <sub>DDA</sub>	V
I <sub>IL</sub>	LOW-level input current		-	55	-	μA
I <sub>IH</sub>	HIGH-level input current		-	65	-	μA

### Serial peripheral interface: pins CS, SDIO/ODS, SCLK/DFS

V <sub>IL</sub>	LOW-level input voltage		0	-	0.3V <sub>DDA</sub>	V
V <sub>IH</sub>	HIGH-level input voltage		0.7V <sub>DDA</sub>	-	V <sub>DDA</sub>	V
I <sub>IL</sub>	LOW-level input current		-10	-	+10	μA
I <sub>IH</sub>	HIGH-level input current		-50	-	+50	μA
C <sub>i</sub>	input capacitance		-	4	-	pF

Table 6. Static characteristics<sup>[1]</sup> ...continued

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
<b>Digital outputs: CMOS mode - pins D13 to D0, OTR, DAV</b>						
Output levels, $V_{DDO} = 3\text{ V}$

## 11. Application information

### 11.1 Device control

The ADC1410S can be controlled via SPI or directly via the I/O pins (Pin control mode).

#### 11.1.1 SPI and PIN control modes

The device enters PIN control mode at power-up, and remains in this mode as long as pin  $\overline{CS}$  is held HIGH. In PIN control mode, the SPI pins SDIO,  $\overline{CS}$  and SCLK are used as static control pins.

SPI control mode is enabled by forcing pin  $\overline{CS}$  LOW. Once SPI control mode has been enabled, the device remains in this mode. The transition from PIN control mode to SPI control mode is illustrated in Figure 19.

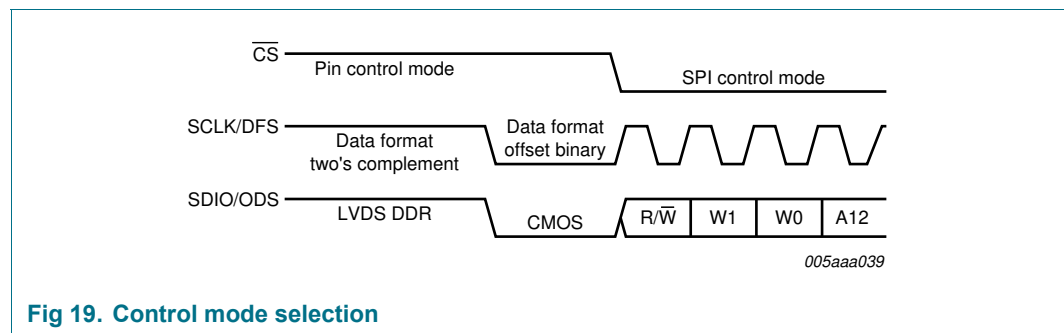

Fig 19. Control mode selection

When the device enters SPI control mode, the output data standard and data format are determined by the level on pin SDIO when a transition is triggered by a falling edge on  $\overline{CS}$ .

#### 11.1.2 Operating mode selection

The active ADC1410S operating mode (Power-up, Power-down or Sleep) can be selected via the SPI interface (see Table 20) or by using pins PWD and  $\overline{OE}$  in Pin control mode (see Table 10).

Table 10. Operating mode selection via pin PWD and  $\overline{OE}$

Pin PWD	Pin $\overline{OE}$	Operating mode	Output high-Z
LOW	LOW	Power-up	no
LOW	HIGH	Power-up	yes
HIGH	LOW	Sleep	yes
HIGH	HIGH	Power-down	yes

#### 11.1.3 Selecting the output data standard

The output data standard (CMOS or LVDS DDR) can be selected via the SPI interface (see Table 23) or by using pin ODS in Pin control mode. LVDS DDR is selected when ODS is HIGH, otherwise CMOS is selected.

### 11.1.4 Selecting the output data format

The output data format can be selected via the SPI interface (offset binary, two's complement or gray code; see Table 23) or using pin DFS in Pin control mode (offset binary or two's complement). Offset binary is selected when DFS is LOW. When DFS is HIGH, two's complement is selected.

## 11.2 Analog inputs

### 11.2.1 Input stage

The analog input of the ADC1410S supports a differential or a single-ended input drive. Optimal performance is achieved using differential inputs with the common-mode input voltage ( $V_{I(cm)}$ ) on pins INP and INM set to  $0.5V_{DDA}$ .

The full-scale analog input voltage range is configurable between 1 V (p-p) and 2 V (p-p) via a programmable internal reference (see Section 11.3 and Table 22).

The equivalent circuit of the sample and hold input stage, including Electrostatic Discharge (ESD) protection and circuit and package parasitics, is shown in Figure 20.

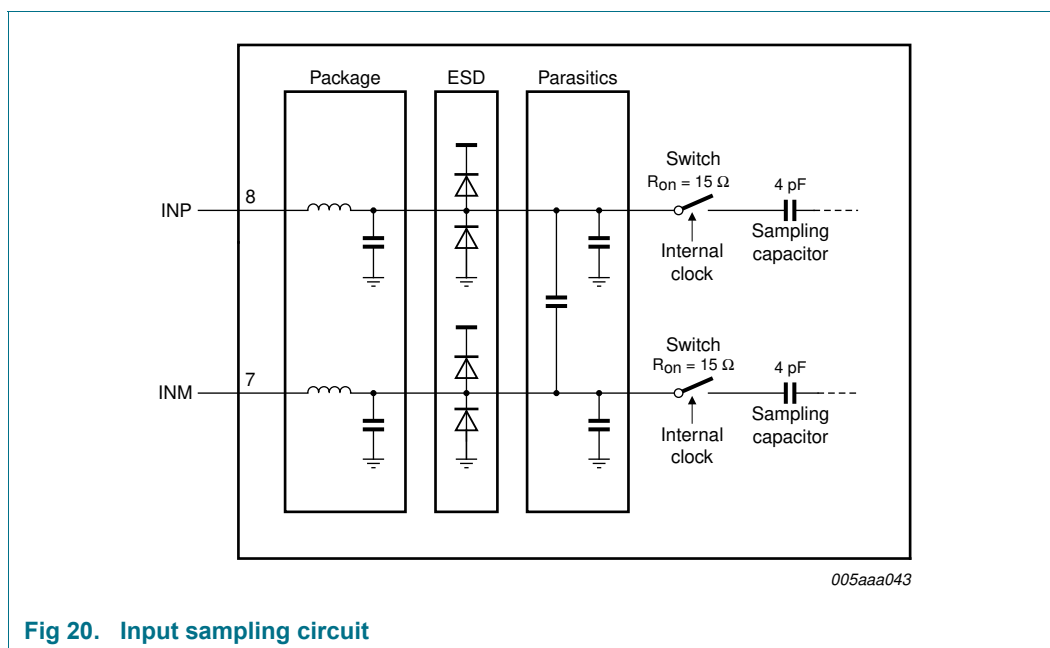

Fig 20. Input sampling circuit

The sample phase occurs when the internal clock (derived from the clock signal on pin CLKP/CLKM) is HIGH. The voltage is then held on the sampling capacitors. When the clock signal goes LOW, the stage enters the hold phase and the voltage information is transmitted to the ADC core.

11.2.2 Anti-kickback circuitry

Anti-kickback circuitry (R-C filter in Figure 21) is needed to counteract the effects of a charge injection generated by the sampling capacitance.

The RC filter is also used to filter noise from the signal before it reaches the sampling stage. The value of the capacitor should be chosen to maximize noise attenuation without degrading the settling time excessively.

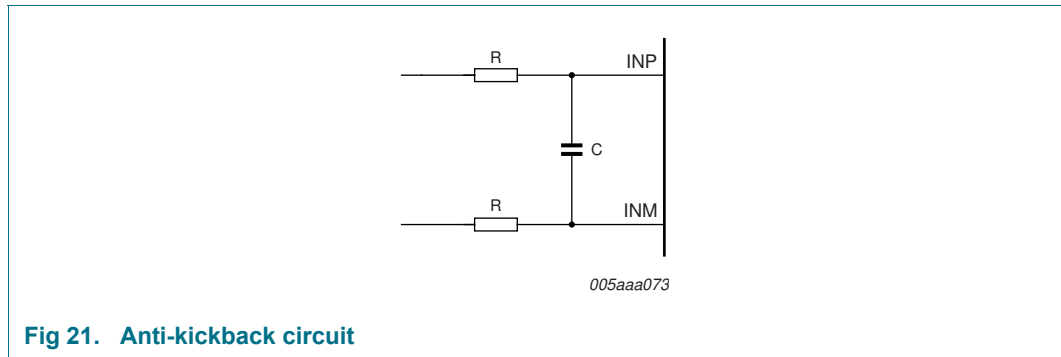

Fig 21. Anti-kickback circuit

The component values are determined by the input frequency and should be selected so as not to affect the input bandwidth.

Table 11. RC coupling versus input frequency, typical values

Input frequency	Resistance	Capacitance
3 MHz	25 Ω	12 pF
70 MHz	12 Ω	8 pF
170 MHz	12 Ω	8 pF

11.2.3 Transformer

The configuration of the transformer circuit is determined by the input frequency. The configuration shown in Figure 22 would be suitable for a baseband application.

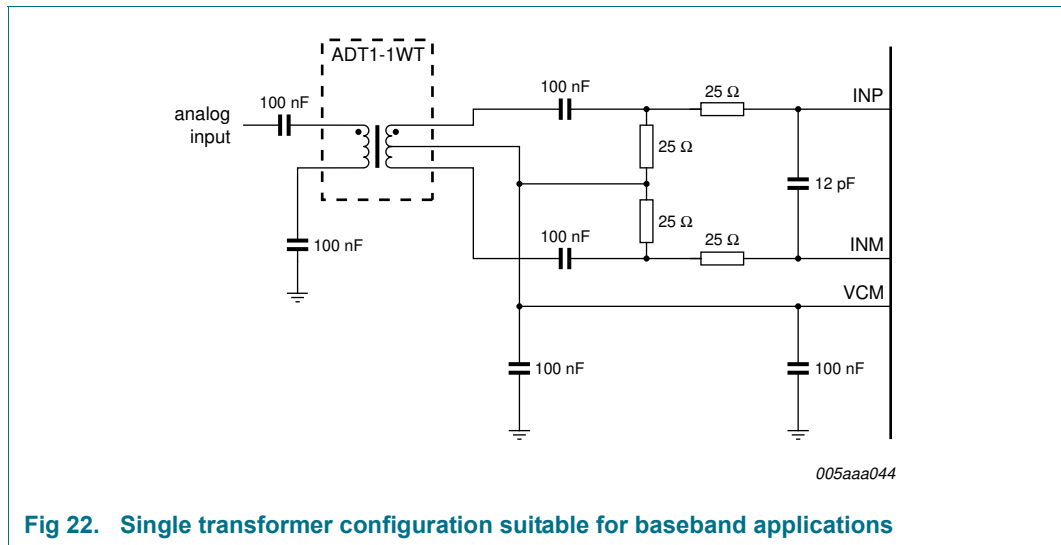

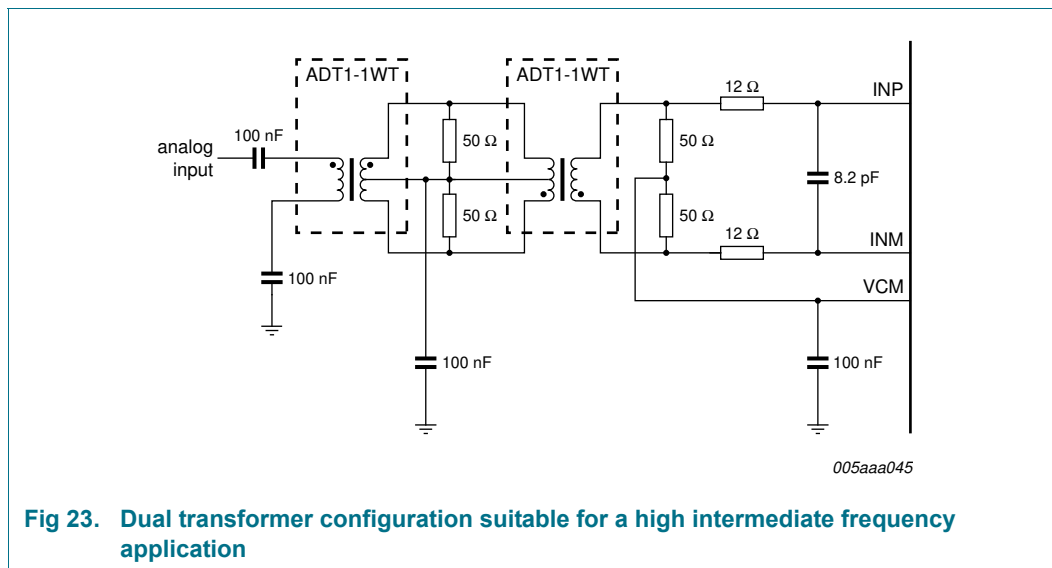

Fig 22. Single transformer configuration suitable for baseband applications

The configuration shown in Figure 23 is recommended for high frequency applications. In both cases, the choice of transformer is a compromise between cost and performance.

## 11.3 System reference and power management

### 11.3.1 Internal/external references

The ADC1410S has a stable and accurate built-in internal reference voltage to adjust the ADC full-scale. This reference voltage can be set internally via SPI or with pins VREF and SENSE (programmable in 1 dB steps between 0 dB and -6 dB via control bits INTREF[2:0] when bit INTREF\_EN = logic 1; see Table 22). See Figure 25 to Figure 28. The equivalent reference circuit is shown in Figure 24. An external reference is also possible by providing a voltage on pin VREF as described in Figure 27.

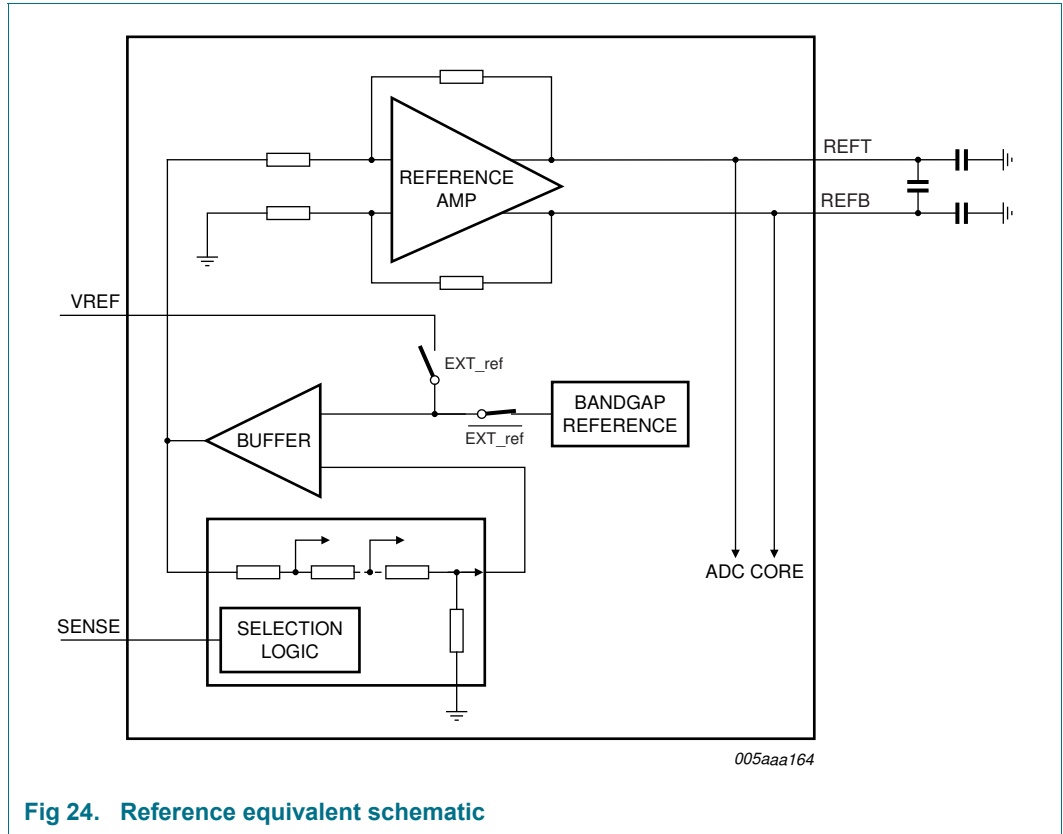

Fig 24. Reference equivalent schematic

If bit INTREF\_EN is set to logic 0, the reference voltage is determined either internally or externally as detailed in Table 12.

Table 12. Reference selection

Selection	SPI bit INTREF_EN	SENSE pin	VREF pin	Full-scale (p-p)
internal (Figure 25)	0	AGND	330 pF capacitor to AGND	2 V
internal (Figure 26)	0	pin VREF connected to pin SENSE and via a 330 pF capacitor to AGND		1 V
external (Figure 27)	0	V <sub>DDA</sub>	external voltage between 0.5 V and 1 V <sup>[1]</sup>	1 V to 2 V
internal via SPI (Figure 28)	1	pin VREF connected to pin SENSE and via 330 pF capacitor to AGND		1 V to 2 V

[1] The voltage on pin VREF is doubled internally to generate the internal reference voltage.

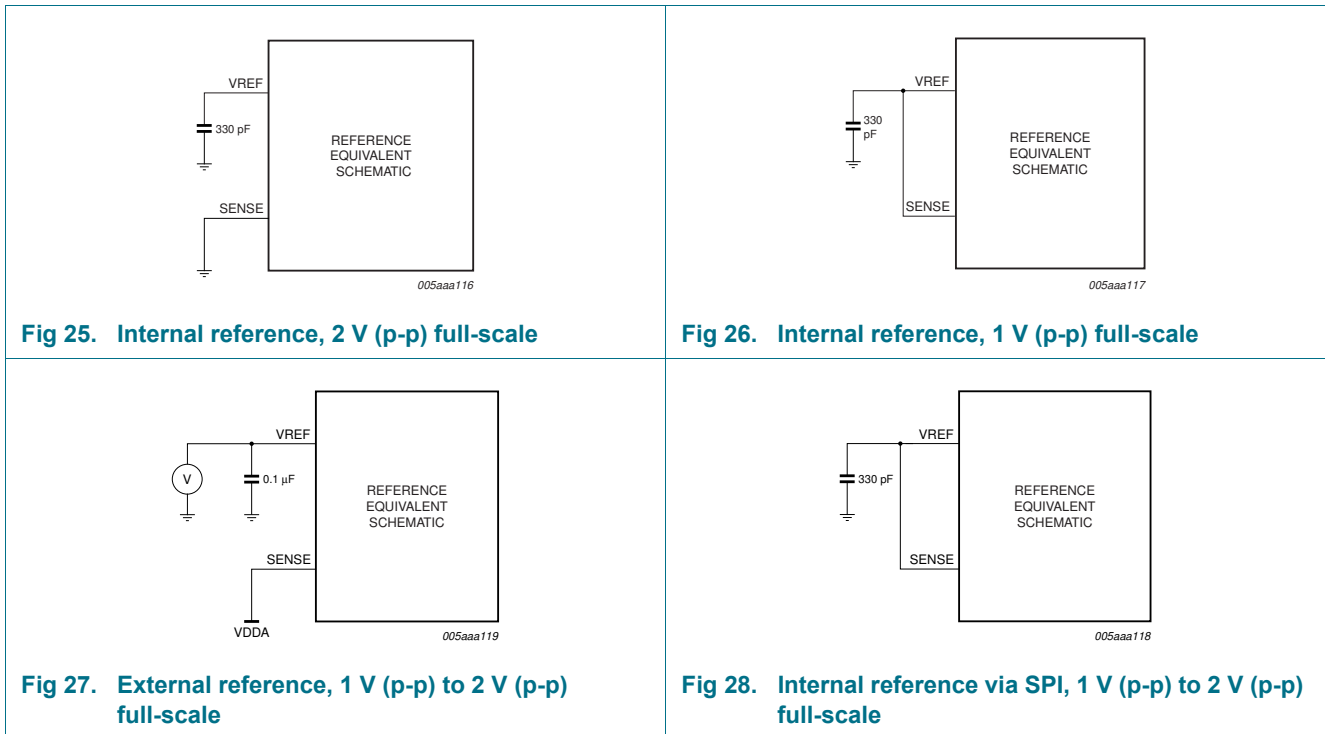

Figure 25 to Figure 28 illustrate how to connect the SENSE and VREF pins to select the required reference voltage source.

### 11.3.2 Programmable full-scale

The full-scale is programmable between 1 V (peak-to-peak) to 2 V (peak-to-peak) (see Table 13).

**Table 13. Reference SPI gain control**

INTREF[2:0]	Full-scale (V (p-p))
000	2
001	1.78
010	1.59
011	1.42
100	1.26
101	1.12
110	1
111	x

### 11.3.3 Common-mode output voltage ( $V_{O(cm)}$ )

A 0.1  $\mu\text{F}$  filter capacitor should be connected between pin VCM and ground to ensure a low-noise common-mode output voltage. When AC-coupled, pin VCM can then be used to set the common-mode reference for the analog inputs, for instance via a transformer middle point.

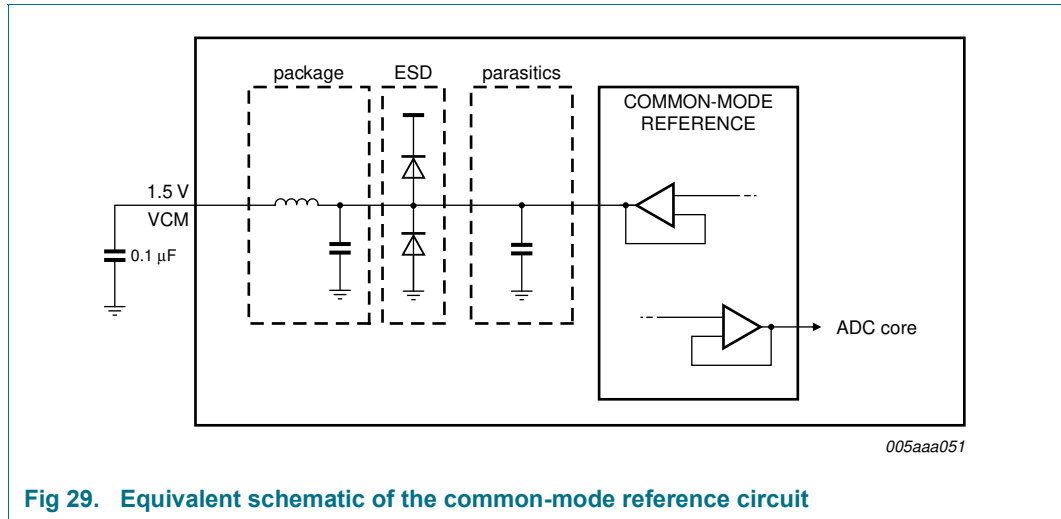

Fig 29. Equivalent schematic of the common-mode reference circuit

### 11.3.4 Biasing

The common-mode input voltage ( $V_{I(cm)}$ ) on pins INP and INM should be set externally to  $0.5V_{DDA}$  for optimal performance and should always be between 1.1 V and 2.5 V (see Table 6).

## 11.4 Clock input

### 11.4.1 Drive modes

The ADC1410S can be driven differentially (LVPECL). It can also be driven by a single-ended Low Voltage Complementary Metal Oxide Semiconductor (LVCMOS) signal connected to pin CLKP (pin CLKM should be connected to ground via a capacitor) or pin CLKM (pin CLKP should be connected to ground via a capacitor).

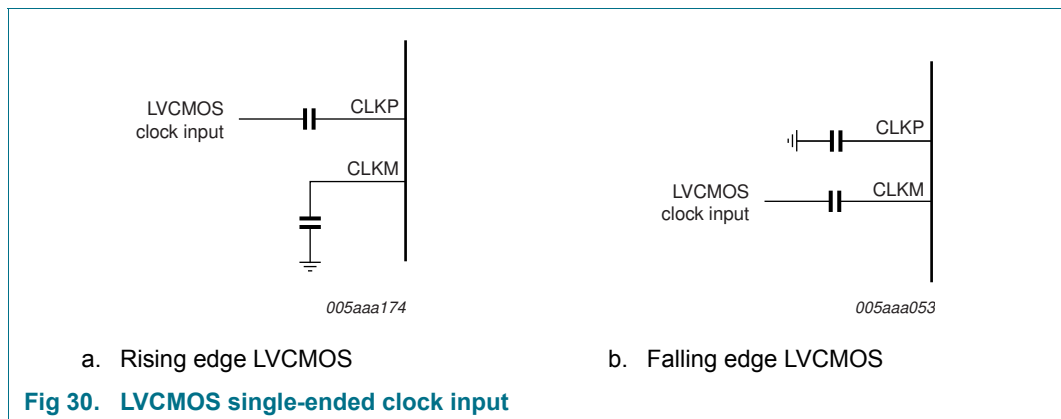

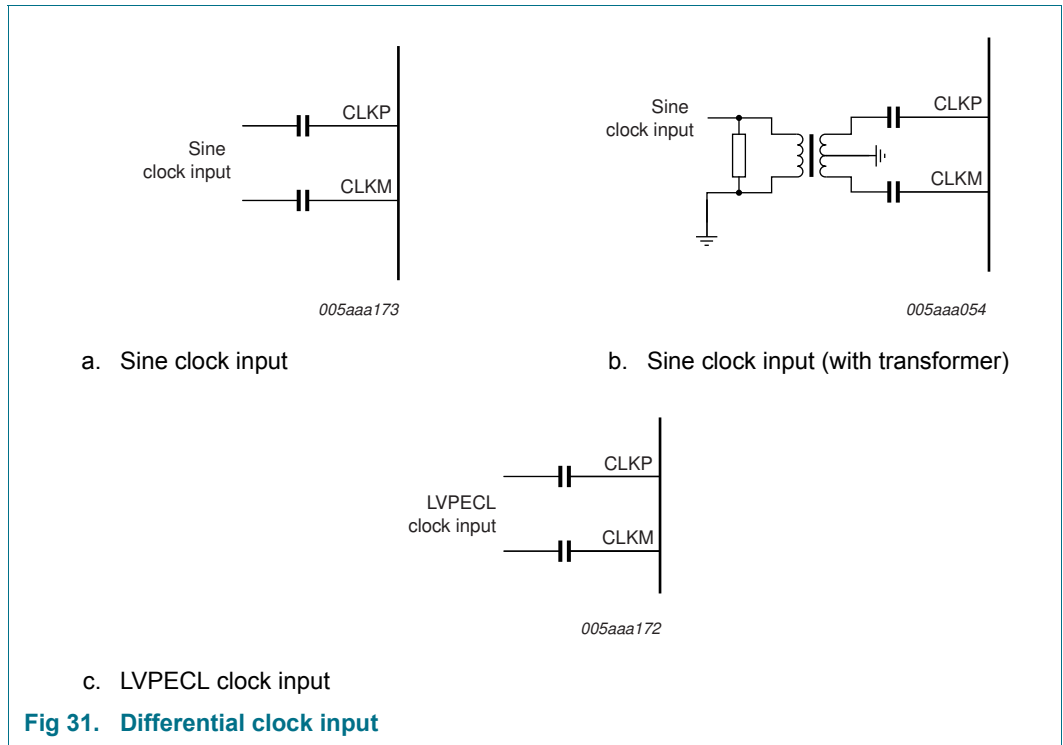

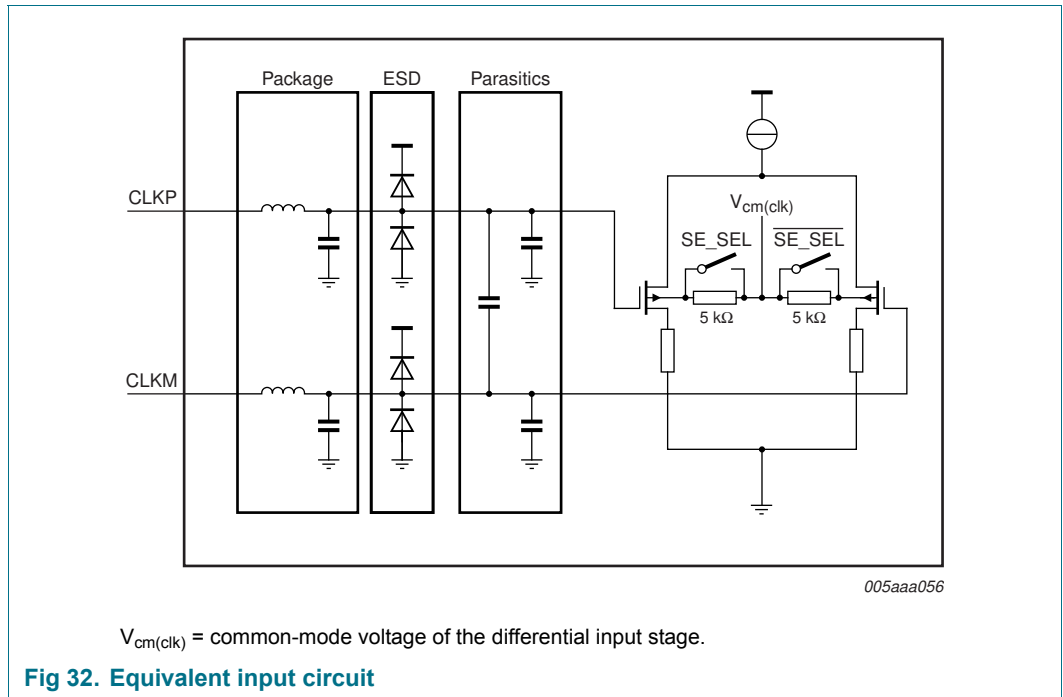

Fig 30. LVCMOS single-ended clock input

11.4.2 Equivalent input circuit

The equivalent circuit of the input clock buffer is shown in Figure 32. The common-mode voltage of the differential input stage is set via internal 5 kΩ resistors.

Single-ended or differential clock inputs can be selected via the SPI interface (see Table 21). If single-ended is enabled, the input pin (CLKM or CLKP) is selected via control bit SE\_SEL.

If single-ended is implemented without setting bit SE\_SEL to the appropriate value, the unused pin should be connected to ground via a capacitor.

### 11.4.3 Duty cycle stabilizer

The duty cycle stabilizer can improve the overall performance of the ADC by compensating the duty cycle of the input clock signal. When the duty cycle stabilizer is active (bit DCS\_EN = logic 1; see Table 21), the circuit can handle signals with duty cycles of between 30 % and 70 % (typical). When the duty cycle stabilizer is disabled (DCS\_EN = logic 0), the input clock signal should have a duty cycle of between 45 % and 55 %.

### 11.4.4 Clock input divider

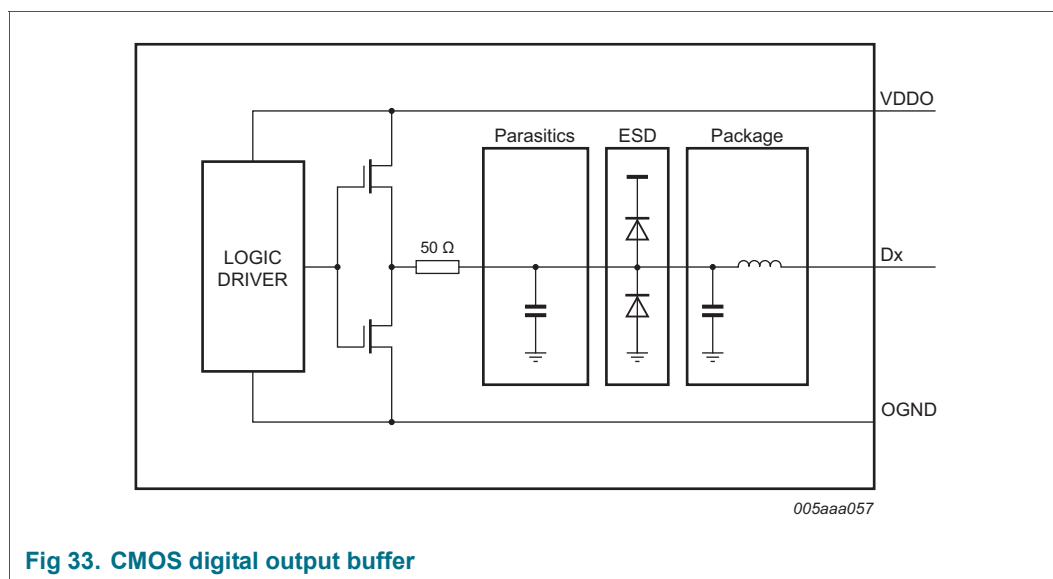

The ADC1410S contains an input clock divider that divides the incoming clock by a factor of 2 (when bit CLKDIV = logic 1; see Table 21). This feature allows the user to deliver a higher clock frequency with better jitter performance, leading to a better SNR result once acquisition has been performed.

## 11.5 Digital outputs

### 11.5.1 Digital output buffers: CMOS mode

The digital output buffers can be configured as CMOS by setting bit LVDS\_CMOS to logic 0 (see Table 23).

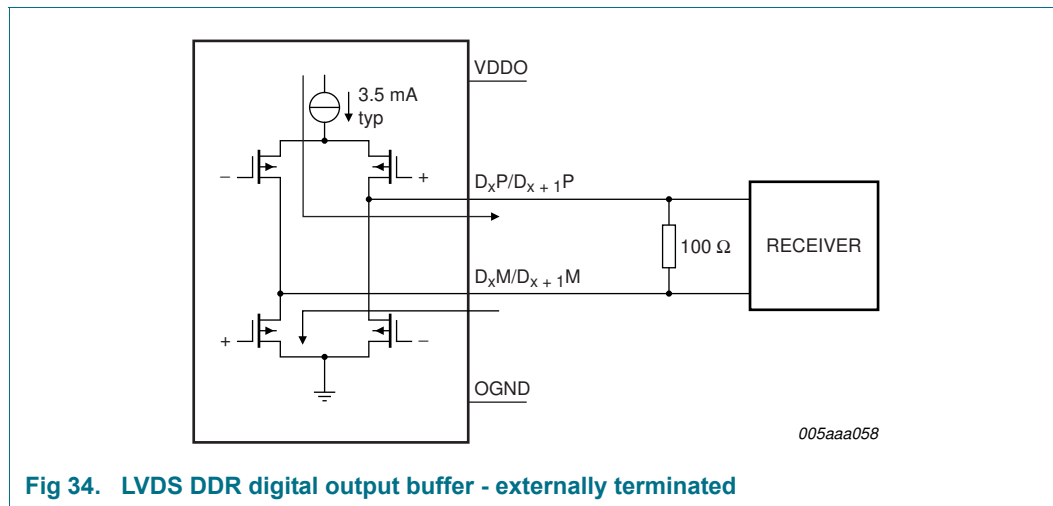

Each digital output has a dedicated output buffer. The equivalent circuit of the CMOS digital output buffer is shown in Figure 33. The buffer is powered by a separate power supply, pins OGND and VDDO, to ensure 1.8 V to 3.3 V compatibility and is isolated from the ADC core. Each buffer can be loaded by a maximum of 10 pF.

The output resistance is  $50\ \Omega$  and is the combination of an internal resistor and the equivalent output resistance of the buffer. There is no need for an external damping resistor. The drive strength of both data and DAV buffers can be programmed via the SPI in order to adjust the rise and fall times of the output digital signals (see Table 30).

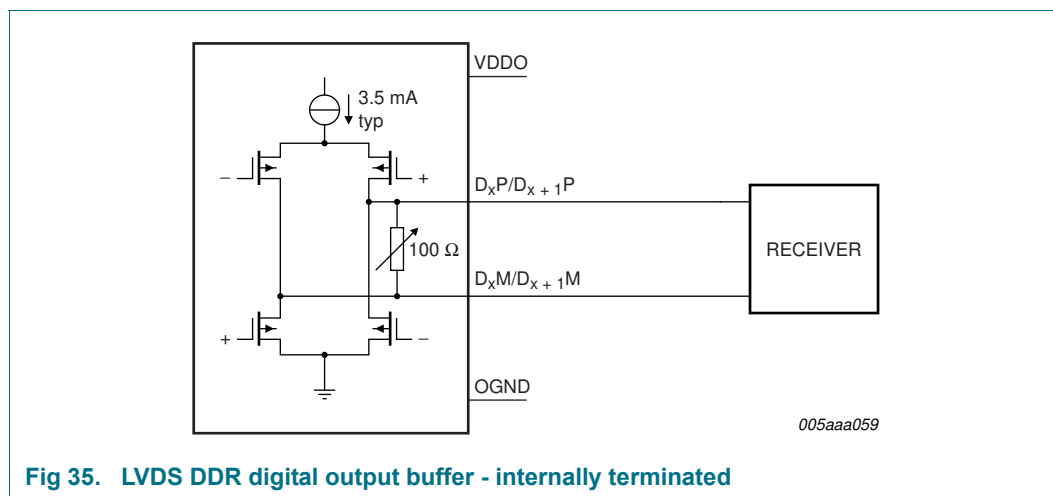

### 11.5.2 Digital output buffers: LVDS DDR mode

The digital output buffers can be configured as LVDS DDR by setting bit LVDS\_CMOS to logic 1 (see Table 23).

**Fig 34. LVDS DDR digital output buffer - externally terminated**

Each output should be terminated externally with a  $100\ \Omega$  resistor (typical) at the receiver side (Figure 34) or internally via SPI control bits LVDS\_INT\_TER[2:0] (see Figure 35 and Table 32).

**Fig 35. LVDS DDR digital output buffer - internally terminated**

The default LVDS DDR output buffer current is set to 3.5 mA. It can be programmed via the SPI (bits DAVI[1:0] and DATAI[1:0]; see Table 31) in order to adjust the output logic voltage levels.
