

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

ADC1613S series

**Single 16-bit ADC; 65 Msps, 80 Msps, 105 Msps or 125 Msps;
serial JESD204A interface**

Rev. 03 — 2 July 2012

Product data sheet

1. General description

The ADC1613S is a single channel 16-bit Analog-to-Digital Converter (ADC) optimized for high dynamic performance and low power at sample rates up to 125 Msps. Pipelined architecture and output error correction ensure the ADC1613S is accurate enough to guarantee zero missing codes over the entire operating range. Supplied from a 3 V source for analog and a 1.8 V source for the output driver, it outputs data in serial mode via a single differential lane, which complies with the JESD204A standard. The integration of Serial Peripheral Interface allows the user to easily configure the ADCs and the serial output modes. The device also includes a programmable full-scale SPI to allow a flexible input voltage range from 1 V (p-p) to 2 V (p-p).

Excellent dynamic performance is maintained from the baseband to input frequencies of 170 MHz or more, making the ADC1613S ideal for use in communications, imaging, and medical applications.

2. Features and benefits

- SNR, 72.3 dBFS; SFDR, 88 dBc
- Sample rates up to 125 Msps
- Single channel, 16-bit pipelined ADC core
- 3 V, 1.8 V power supplies
- Flexible input voltage range:
1 V (p-p) to 2 V (p-p)
- Serial output
- Power-down mode and Sleep mode
- Pin compatible with ADC1413S series,
ADC1213S series, and ADC1113S125
- Input bandwidth, 600 MHz
- Power dissipation, 550 mW at 80 Msps
- SPI register programming
- Duty cycle stabilizer
- High Intermediate Frequency (IF) capability
- Offset binary, two's complement, gray code
- Compliant with JESD204A serial transmission standard
- HVQFN32 package

3. Applications

- Wireless and wired broadband communications
- Spectral analysis
- Ultrasound equipment
- Portable instrumentation
- Imaging systems

4. Ordering information

Table 1. Ordering information

Type number	Sampling frequency (Msps)	Package			Version
		Name	Description		
ADC1613S125HN-C1	125	HVQFN32R	plastic thermal enhanced very thin quad flat package; no leads; 32 terminals; body 7 × 7 × 0.8 mm		SOT1152-1
ADC1613S105HN-C1	105	HVQFN32R	plastic thermal enhanced very thin quad flat package; no leads; 32 terminals; body 7 × 7 × 0.8 mm		SOT1152-1
ADC1613S080HN-C1	80	HVQFN32R	plastic thermal enhanced very thin quad flat package; no leads; 32 terminals; body 7 × 7 × 0.8 mm		SOT1152-1
ADC1613S065HN-C1	65	HVQFN32R	plastic thermal enhanced very thin quad flat package; no leads; 32 terminals; body 7 × 7 × 0.8 mm		SOT1152-1

6.2 Pin description

Table 2. Pin description

Symbol	Pin	Type ^[1]	Description
CLKP	1	I	clock input
CLKM	2	I	complementary clock input
AGND	3	G	analog ground
REFB	4	O	ADC bottom reference
REFT	5	O	ADC top reference
VCM	6	O	ADC output common voltage
INM	7	I	ADC complementary analog input
INP	8	I	ADC analog input
VDDA	9	P	analog power supply 3 V
VDDA	10	P	analog power supply 3 V
SCLK	11	I	SPI clock
SDIO	12	I/O	SPI data input/output

Table 2. Pin description ...continued

Symbol	Pin	Type ^[1]	Description
CS	13	I	chip select
OTR	14	O	out-of-range information
VDDD	15	P	digital power supply 1.8 V
DGND	16	G	digital ground
DGND	17	G	digital ground
VDDD	18	P	digital power supply 1.8 V
CMLP	19	O	serial output
CMLN	20	O	serial complementary output
VDDD	21	P	digital power supply 1.8 V
DGND	22	G	digital ground
DGND	23	G	digital ground
n.c.	24	-	not connected
SYNCP	25	I	positive synchronization signal from the receiver
SYNCN	26	I	negative synchronization signal from the receiver
VDDD	27	P	digital power supply 1.8 V
DGND	28	G	digital ground
VDDA	29	P	analog power supply 3 V
AGND	30	G	analog ground
SENSE	31	I	reference programming pin
VREF	32	I/O	voltage reference input/output

[1] P: power supply; G: ground; I: input; O: output; I/O: input/output.

7. Limiting values

Table 3. Limiting values

In accordance with the Absolute Maximum Rating System (IEC 60134).

Symbol	Parameter	Conditions	Min	Max	Unit
V _{DDA}	analog supply voltage		-0.4	+4.6	V
V _{DDD(1V8)}	digital supply voltage (1.8 V)		-0.4	+2.5	V
T _{stg}	storage temperature		-55	+125	°C
T _{amb}	ambient temperature		-40	+85	°C
T _j	junction temperature		-	125	°C

8. Thermal characteristics

Table 4. Thermal characteristics

Symbol	Parameter	Conditions	Typ	Unit
R _{th(j-a)}	thermal resistance from junction to ambient		[1] 25.6	K/W
R _{th(j-c)}	thermal resistance from junction to case		[1] 8.6	K/W

[1] Value for six layers board in still air with a minimum of 25 thermal vias.

9. Static characteristics

Table 5. Static characteristics [1]

Symbol	Parameter	Conditions	Min	Typ	Max	Unit	
Supplies							
V_{DDA}	analog supply voltage		2.85	3.0	3.4	V	
$V_{DDD(1V8)}$	digital supply voltage (1.8 V)		1.65	1.8	1.95	V	
I_{DDA}	analog supply current	$f_{clk} = 125 \text{ Msps}; f_i = 70 \text{ MHz}$	-	185	-	mA	
$I_{DDD(1V8)}$	digital supply current (1.8 V)	$f_{clk} = 125 \text{ Msps}; f_i = 70 \text{ MHz}$	-	75	-	mA	
P_{tot}	total power dissipation	$f_{clk} = 125 \text{ Msps}$	-	690	-	mW	
		$f_{clk} = 105 \text{ Msps}$	-	625	-	mW

t_{wake}	wake-up time		-	76	-	-	76	-	-	76	-	-	76	-	ns

[1] Typical values measured at $V_{DDA} = 3 \text{ V}$, $V_{DDD(1V8)} = 1.8 \text{ V}$, $T_{amb} = 25^\circ\text{C}$. Minimum and maximum values are across the full temperature range $T_{amb} = -40^\circ\text{C}$ to $+85^\circ\text{C}$ at $V_{DDA} = 3 \text{ V}$, $V_{DDD(1V8)} = 1.8 \text{ V}$; $V_{i(INP)} - V_{i(INM)} = -1 \text{ dBFS}$; internal reference mode; 100Ω differential applied to serial outputs; unless otherwise specified.

10.3 Serial output timing

The eye diagram of the serial output is shown in Figure 3 and Figure 4. Test conditions are:

- 3.125 Gbps data rate
- $T_{amb} = 25^\circ\text{C}$
- DC-coupling with two different receiver common-mode voltages

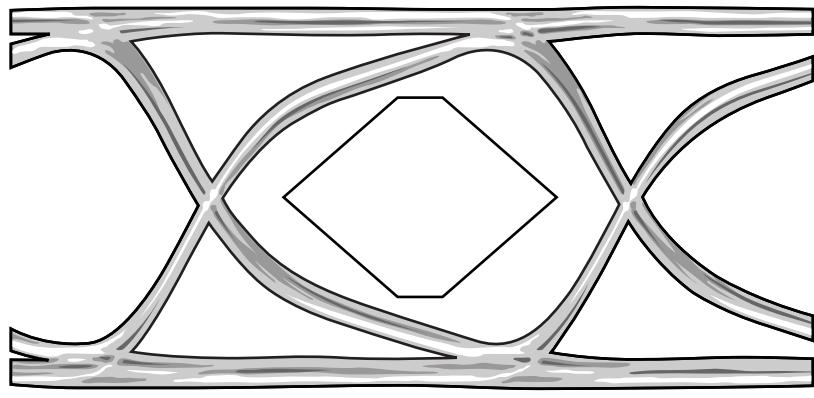

Fig 3. Eye diagram at 1 V receiver common-mode

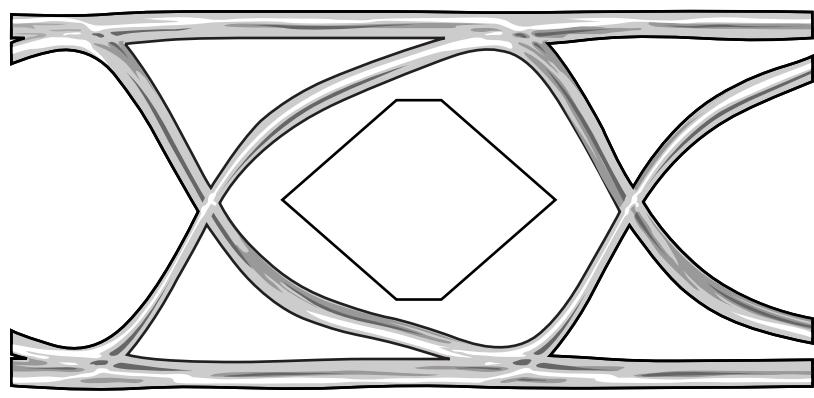

Fig 4. Eye diagram at 2 V receiver common-mode

10.4 SPI timing

Table 8. SPI timing characteristics [1]

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_w(\text{SCLK})$	SCLK pulse width		-	40	-	ns
$t_w(\text{SCLKH})$	SCLK HIGH pulse width		-	16	-	ns
$t_w(\text{SCLKL})$	SCLK LOW pulse width		-	16	-	ns
t_{su}	set-up time	data to SCLK HIGH $\overline{\text{CS}}$ to SCLK HIGH	-	5	-	ns
t_h	hold time	data to SCLK HIGH $\overline{\text{CS}}$ to SCLK HIGH	-	2	-	ns
$f_{\text{clk(max)}}$	maximum clock frequency		-	25	-	MHz

[1] Typical values measured at $V_{\text{DDA}} = 3 \text{ V}$, $V_{\text{DDD(1V8)}} = 1.8 \text{ V}$, $T_{\text{amb}} = 25^\circ\text{C}$. Minimum and maximum values are across the full temperature range $T_{\text{amb}} = -40^\circ\text{C}$ to $+85^\circ\text{C}$ at $V_{\text{DDA}} = 3 \text{ V}$, $V_{\text{DDD(1V8)}} = 1.8 \text{ V}$; $V_{i(\text{INP})} - V_{i(\text{INM})} = -1 \text{ dBFS}$; internal reference mode; 100 Ω differential applied to serial outputs; unless otherwise specified.

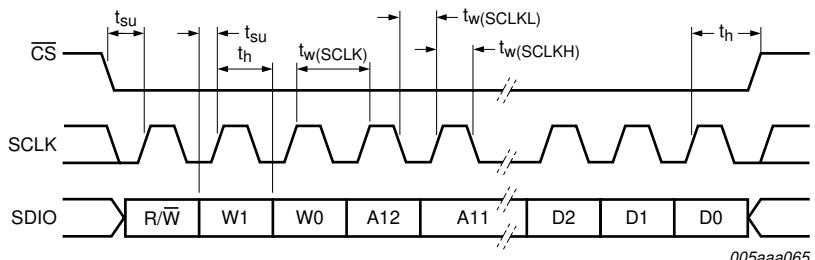

Fig 5. SPI timing

11. Application information

11.1 Analog inputs

11.1.1 Input stage description

The analog input of the ADC1613S supports a differential or a single-ended input drive. Optimal performance is achieved using differential inputs with the common-mode input voltage ($V_{I(cm)}$) on pins INP and INM set to 0.5V_{DDA}.

The full-scale analog input voltage range is configurable between 1 V (p-p) and 2 V (p-p) via a programmable internal reference (see Section 11.2 and Table 21).

Figure 6 shows the equivalent circuit of the sample-and-hold input stage, including ElectroStatic Discharge (ESD) protection and circuit and package parasitics.

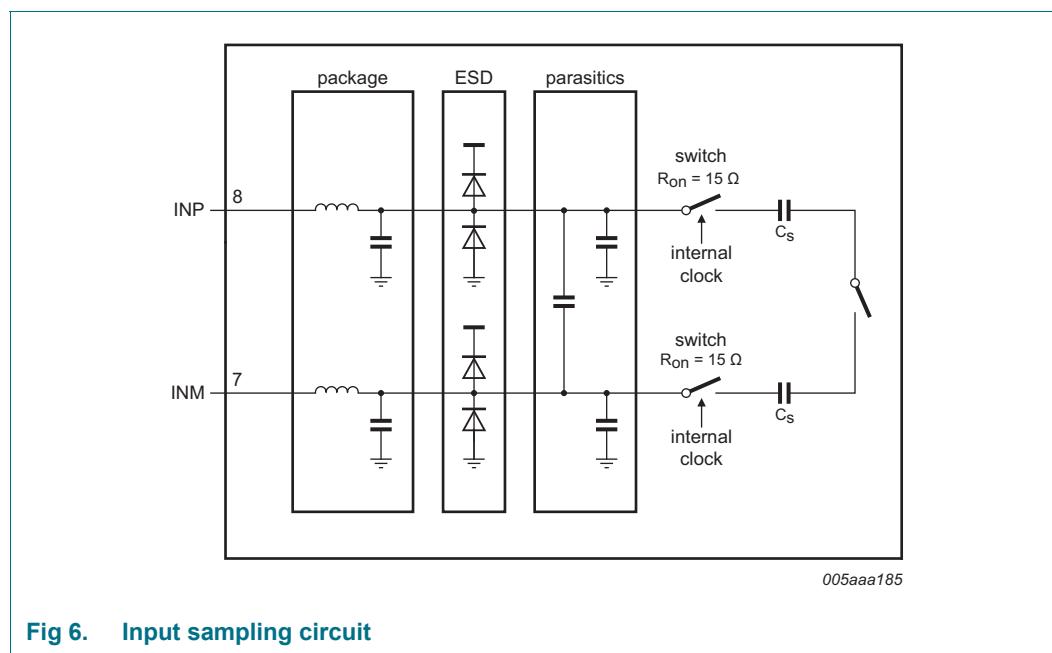

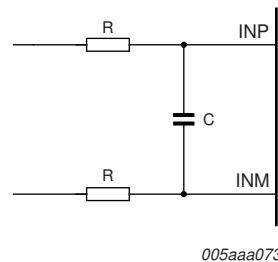

Fig 6. Input sampling circuit

The sample phase occurs when the internal clock (derived from the clock signal on pin CLKP/CLKM) is HIGH. The voltage is then held on the sampling capacitors. When the clock signal goes LOW, the stage enters the hold phase and the voltage information is transmitted to the ADC core.

11.1.2 Anti-kickback circuitry

Anti-kickback circuitry (RC filter in Figure 7) is needed to counteract the effects of a charge injection generated by the sampling capacitance.

The RC filter is also used to filter noise from the signal before it reaches the sampling stage. The value of the capacitor should be chosen to maximize noise attenuation without degrading the settling time excessively.

**Fig 7. Anti-kickback circuit**

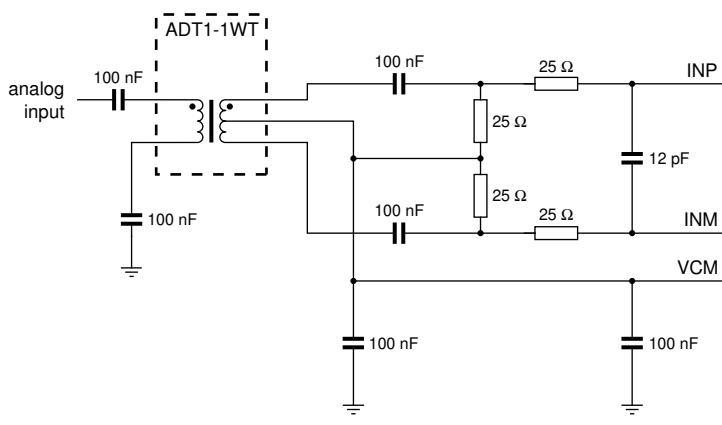

The component values are determined by the input frequency and should be selected so as not to affect the input bandwidth.

Table 9. RC coupling versus input frequency, typical values

Input frequency (MHz)	Resistance (Ω)	Capacitance (pF)
3	25	12
70	12	8
170	12	8

11.1.3 Transformer

The configuration of the transformer circuit is determined by the input frequency. The configuration shown in Figure 8 would be suitable for a baseband application.

**Fig 8. Single transformer configuration**

The configuration shown in Figure 9 is recommended for high frequency applications. In both cases, the choice of transformer is a compromise between cost and performance.

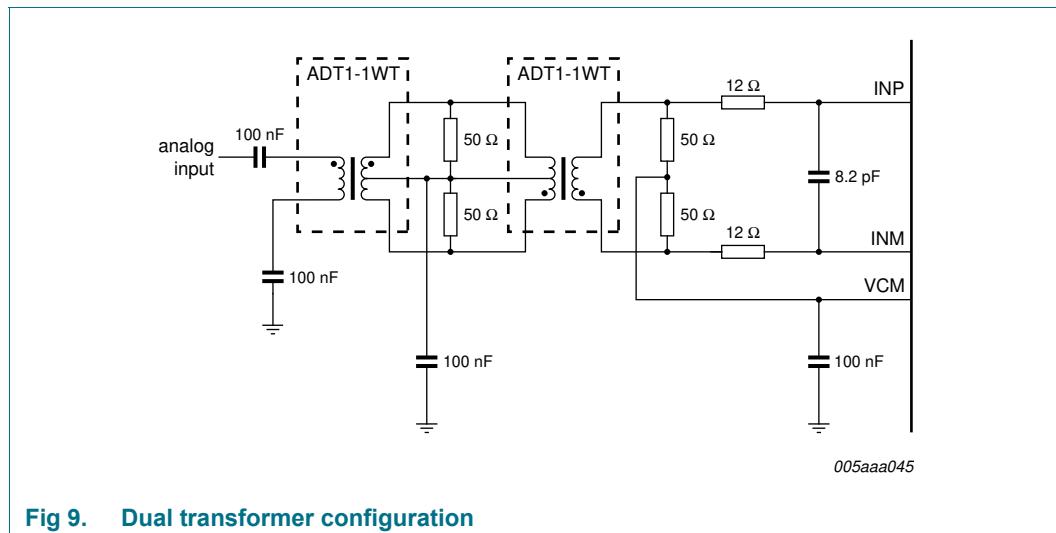

Fig 9. Dual transformer configuration

11.2 System reference and power management

11.2.1 Internal/external reference

The ADC1613S has a stable and accurate built-in internal reference voltage to adjust the ADC full-scale. This reference voltage can be set internally via SPI or with pins VREF and SENSE (see Figure 11 to Figure 14), in 1 dB steps between 0 dB and -6 dB, via SPI control bits INTREF[2:0] (when bit INTREF_EN = logic 1; see Table 21). The equivalent reference circuit is shown in Figure 10. External reference is also possible by providing a voltage on pin VREF as described in Figure 14.

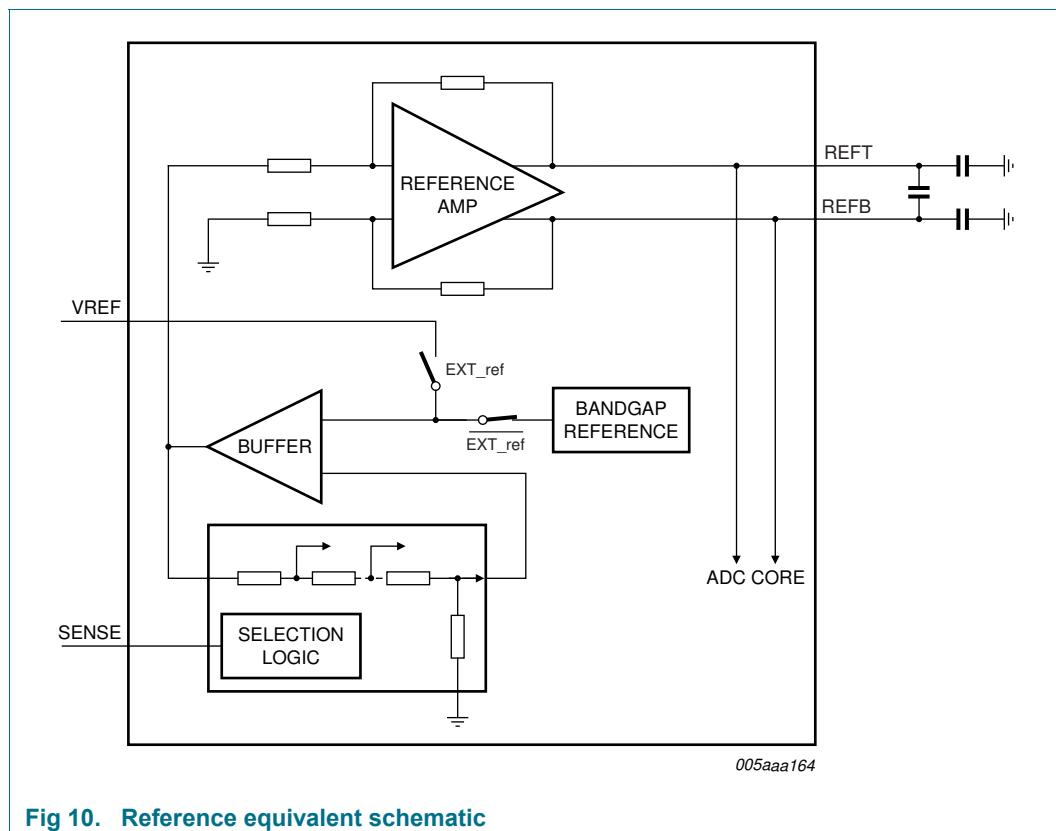

Table 10 shows how to choose between the different internal/external modes:

Table 10. Reference modes

Mode	SPI bit, “Internal reference”	SENSE pin	VREF pin	Full-scale, (V (p-p))
Internal (Figure 11)	0	GND	330 pF capacitor to GND	2
Internal (Figure 12)	0	VREF pin = SENSE pin and 330 pF capacitor to GND		1
Internal, SPI mode (Figure 13)	1	VREF pin = SENSE pin and 330 pF capacitor to GND		1 to 2
External (Figure 14)	0	V _{DDA}	External voltage from 0.5 V to 1 V	1 to 2

Figure 11 to Figure 14 illustrate how to connect the SENSE and VREF pins to select the required reference voltage source.

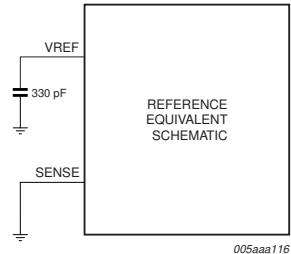

Fig 11. Internal reference, 2 V (p-p) full-scale

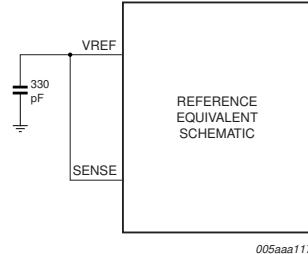

Fig 12. Internal reference, 1 V (p-p) full-scale

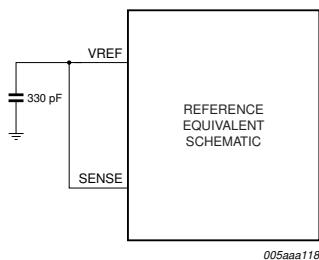

Fig 13. Internal reference via SPI, 1 V (p-p) to 2 V (p-p) full-scale

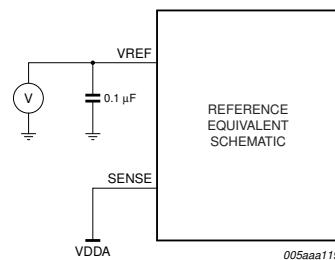

Fig 14. External reference, 1 V (p-p) to 2 V (p-p) full-scale

11.2.2 Programmable full-scale

The full-scale is programmable between 1 V (p-p) to 2 V (p-p) (see Table 11).

Table 11. Reference modes

INTREF[2:0]	Level	Full-scale (V (p-p))
000	0 dB	2
001	-1 dB	1.78
010	-2 dB	1.59
011	-3 dB	1.42
100	-4 dB	1.26
101	-5 dB	1.12
110	-6 dB	1
111	not used	x

11.2.3 Common-mode output voltage ($V_{O(cm)}$)

An 0.1 μ F filter capacitor should be connected between pin VCM and ground to ensure a low-noise common-mode output voltage. When AC-coupled, these pins can be used to set the common-mode reference for the analog inputs, for instance via a transformer middle point.

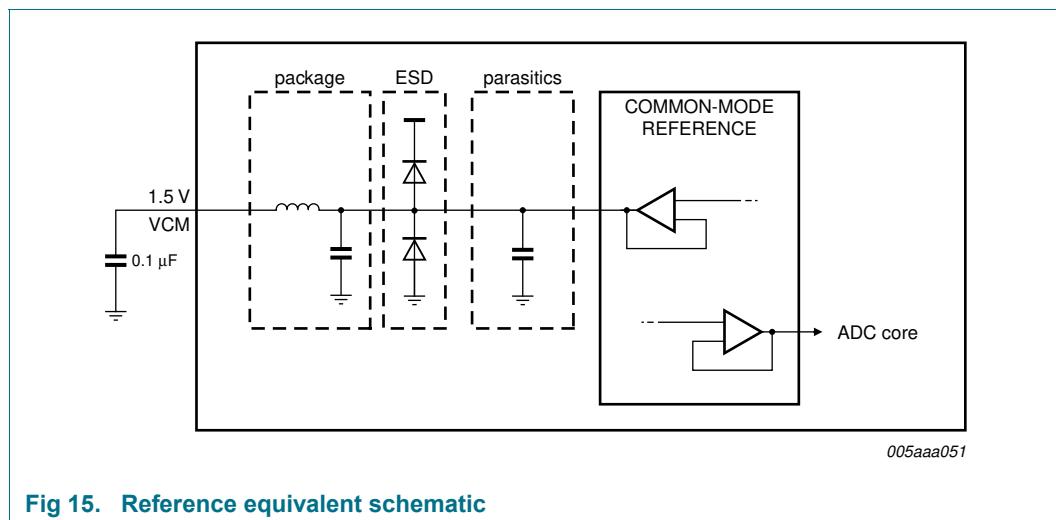

Fig 15. Reference equivalent schematic

11.2.4 Biasing

The common-mode input voltage ($V_{I(cm)}$) on pins INP and INM should be set externally to $0.5V_{DDA}$ for optimal performance and should always be between 0.9 V and 2 V.

11.3 Clock input

11.3.1 Drive modes

The ADC1613S can be driven differentially (LVPECL). It can also be driven by a single-ended LVCMOS signal connected to pin CLKP (CLKM should be connected to ground via a capacitor).

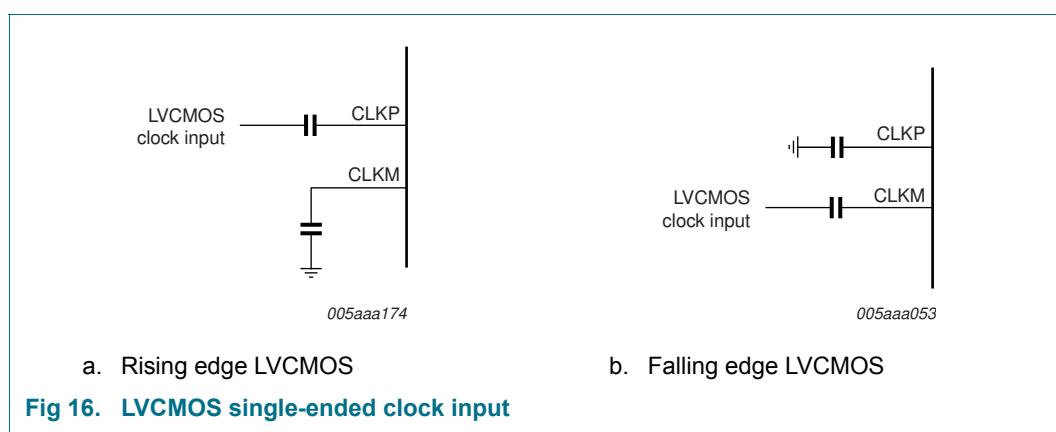

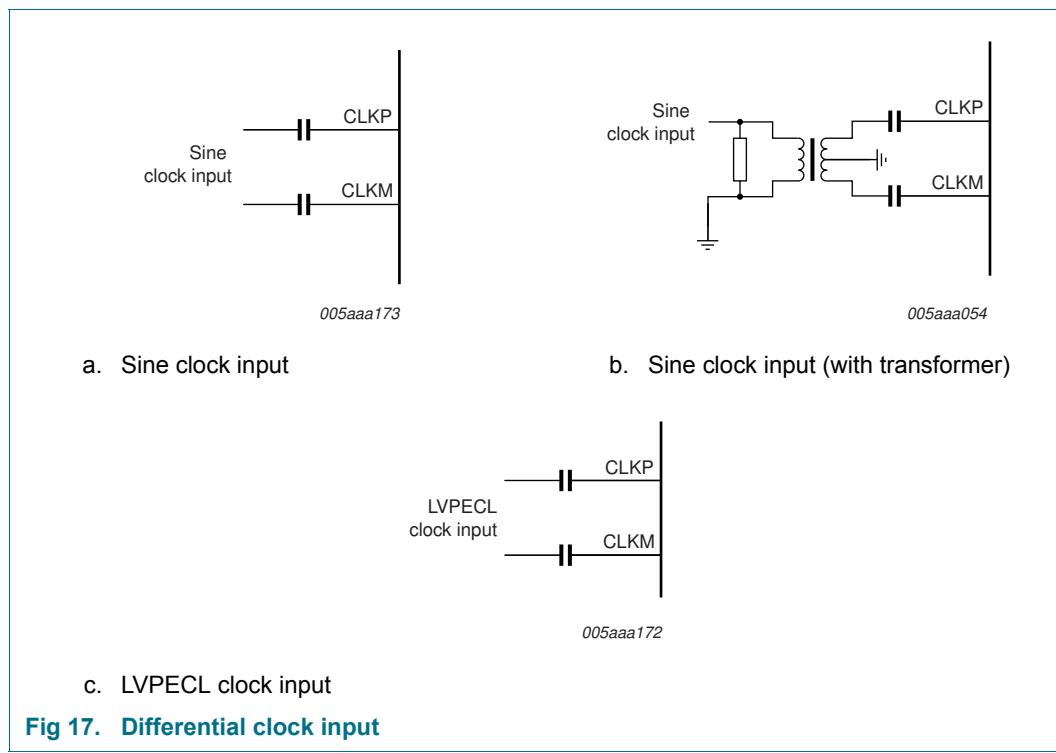

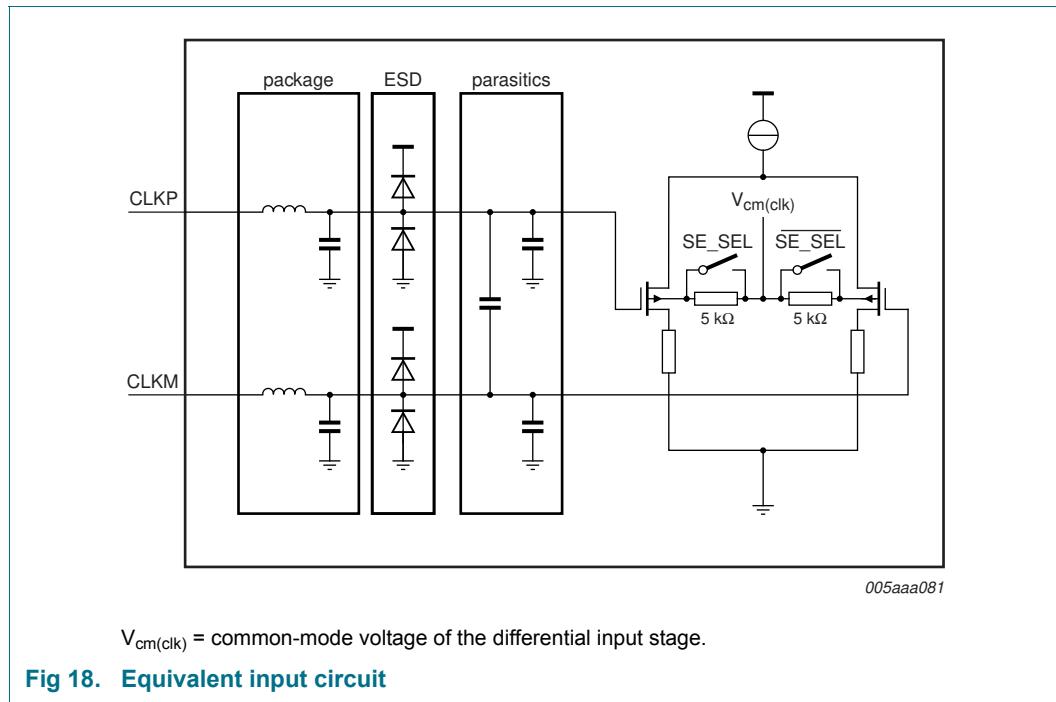

Fig 16. LVCMOS single-ended clock input

11.3.2 Equivalent input circuit

The equivalent circuit of the input clock buffer is shown in Figure 18. The common-mode voltage of the differential input stage is set via internal $5\text{ k}\Omega$ resistors.

Single-ended or differential clock inputs can be selected via the SPI (see Table 20). If single-ended is selected, the input pin (CLKM or CLKP) is selected via control bit SE_SEL.

If single-ended is implemented without setting bit SE_SEL accordingly, the unused pin should be connected to ground via a capacitor.

11.3.3 Duty cycle stabilizer

The duty cycle stabilizer can improve the overall performance of the ADC by compensating the input clock signal duty cycle. When the duty cycle stabilizer is active (bit DCS_EN = logic 1; see Table 20), the circuit can handle signals with duty cycles of between 30 % and 70 % (typical). When the duty cycle stabilizer is disabled (DCS_EN = logic 0), the input clock signal should have a duty cycle of between 45 % and 55 %.

Table 12. Duty cycle stabilizer

bit DCS_EN	Description
0	duty cycle stabilizer disable
1	duty cycle stabilizer enable

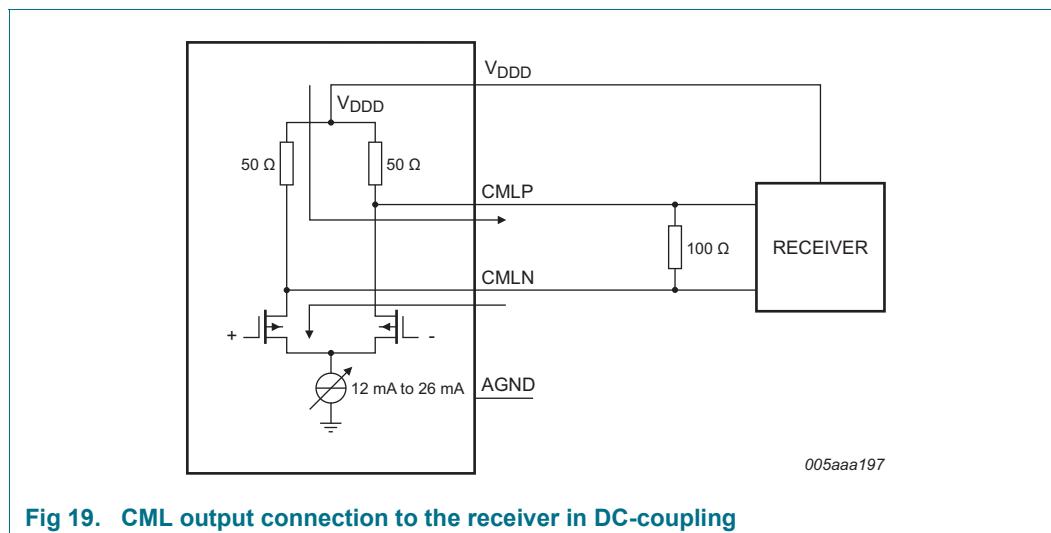

11.3.4 Clock input divider

The ADC1613S contains an input clock divider that divides the incoming clock by a factor of 2 (when bit CLKDIV2_SEL = logic 1; see Table 20). This feature allows the user to deliver a higher clock frequency with better jitter performance, leading to a better SNR result once acquisition has been performed.

11.4 Digital outputs

11.4.1 Serial output equivalent circuit

The JESD204A standard specifies that if the receiver and the transmitter are DC-coupled, both must be fed from the same supply.

The output should be terminated when 100 Ω (typical) is reached at the receiver side.

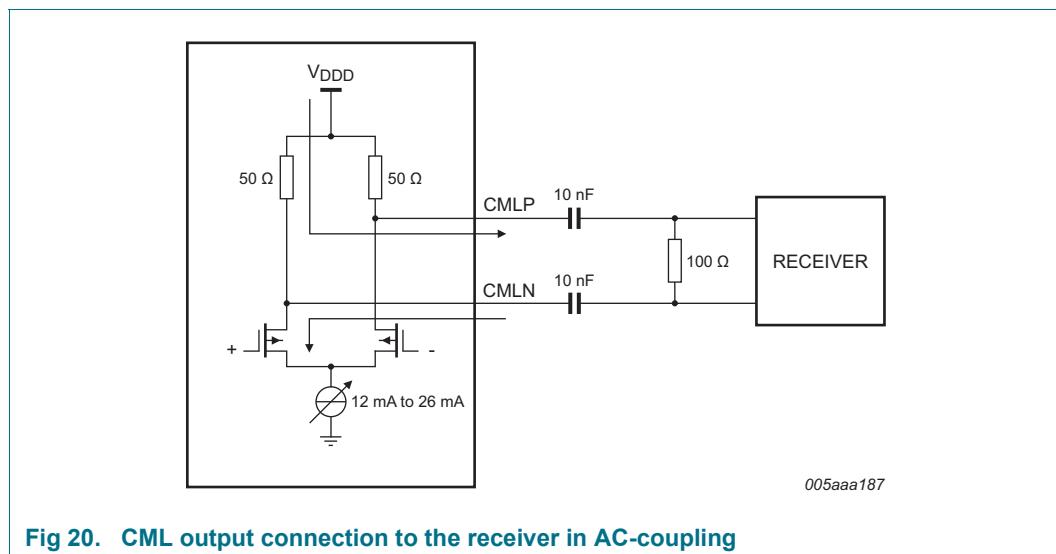

Fig 20. CML output connection to the receiver in AC-coupling

11.5 JESD204A serializer

For more information about the JESD204A standard refer to the JEDEC web site.

11.5.1 Digital JESD204A formatter

The block placed after the ADC cores is used to implement all functions of the JESD204A standard. This ensures signal integrity and guarantees the clock and the data recovery at the receiver side.

The block is highly parameterized and can be configured in various ways depending on the sampling frequency and the number of lanes used.

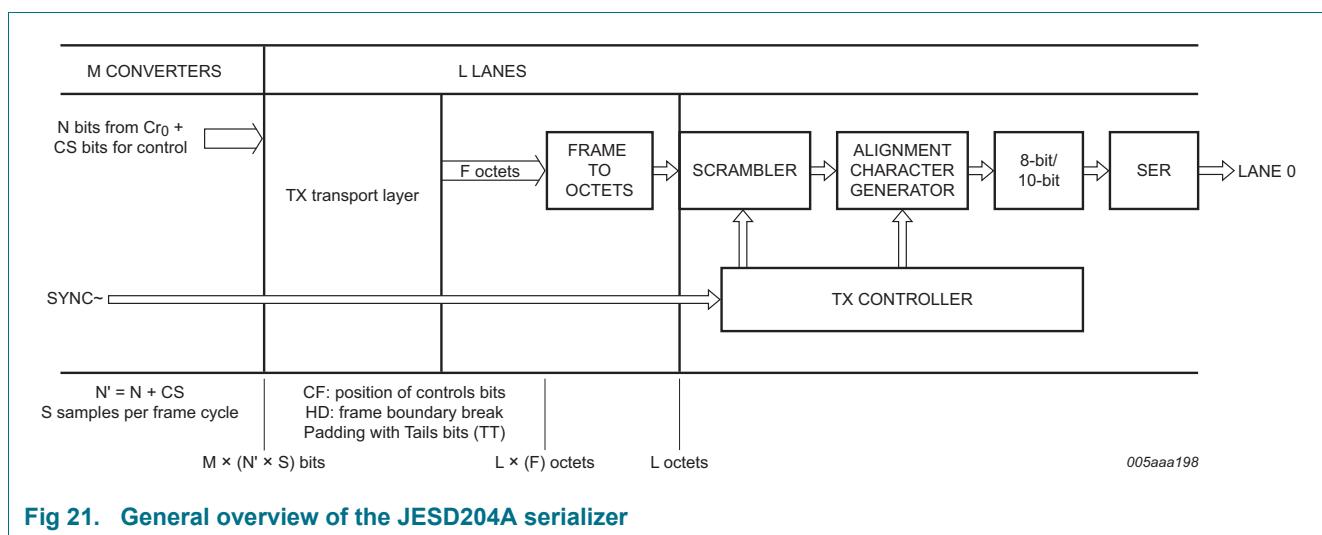

Fig 21. General overview of the JESD204A serializer

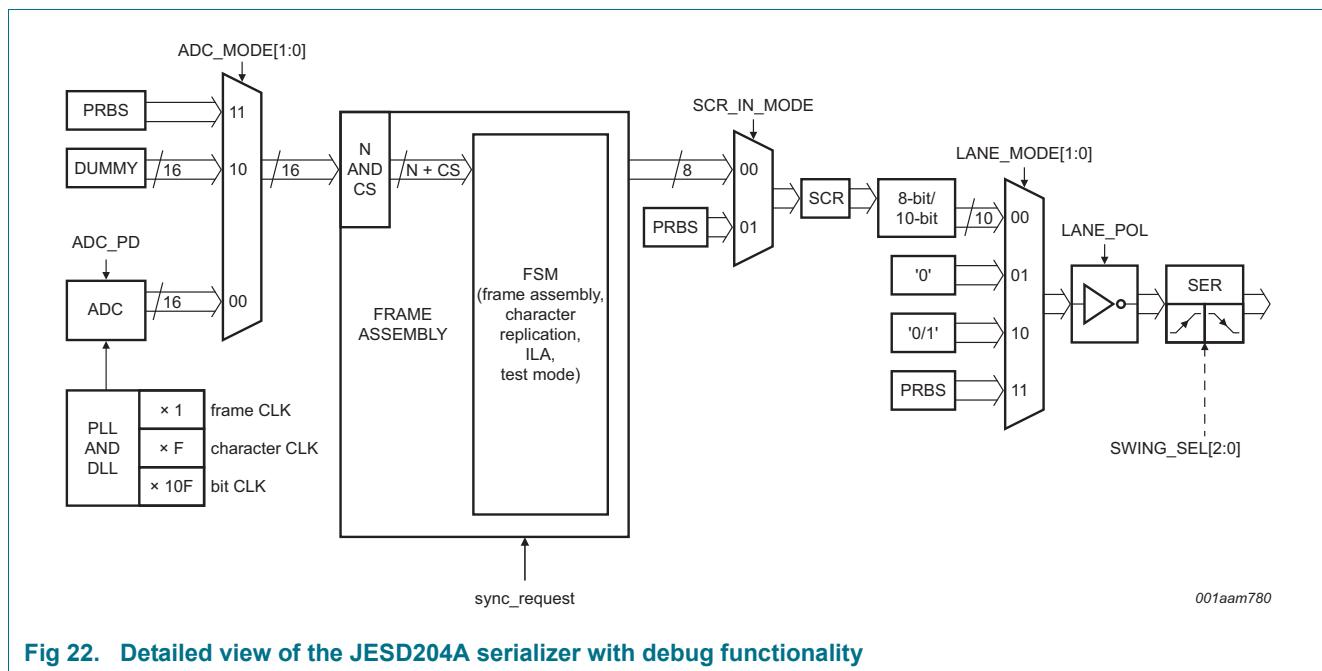

Fig 22. Detailed view of the JESD204A serializer with debug functionality

11.5.2 ADC core output codes versus input voltage

Table 13 shows the data output codes for a given analog input voltage.

Table 13. Output codes versus input voltage

11.6 Serial Peripheral Interface (SPI)

11.6.1 Register description

The ADC1613S serial interface is a synchronous serial communications port allowing easy interfacing with many industry microprocessors. It provides access to the registers that control the operation of the chip in both read and write modes.

This interface is configured as a 3-wire type (SDIO as bidirectional pin).

Pin SCLK acts as the serial clock and pin \overline{CS} acts as the serial chip select.

Each read/write operation is sequenced by the \overline{CS} signal and enabled by a LOW level to drive the chip with N bytes, depending on the content of the instruction byte (see Table 14).

Table 14. Instruction bytes for the SPI

Bit	7	6	5	4	3	2	1	0
Description	R/W ^[1]	W1	W0	A12	A11	A10	A9	A8
	A7	A6	A5	A4	A3	A2	A1	A0

[1] R/W indicates whether a read or write transfer occurs after the instruction byte

Table 15. Read or Write mode access description

R/W ^[1]	Description
0	Write mode operation
1	Read mode operation

[1] Bits W1 and W0 indicate the number of bytes transferred.

Table 16. Number of bytes to be transferred

W1	W0	Number of bytes transferred
0	0	1 byte
0	1	2 bytes
1	0	3 bytes
1	1	4 or more bytes

Bits A12 to A0 indicate the address of the register being accessed. In the case of a multiple byte transfer, this address is the first register to be accessed. An address counter is incremented to access subsequent addresses.

The steps involved in a data transfer are as follows:

1. The falling edge on pin \overline{CS} in combination with a rising edge on pin SCLK determine the start of communications.
2. The first phase is the transfer of the 2-byte instruction.
3. The second phase is the transfer of the data which can be vary in length but is always a multiple of 8 bits. The MSB is always sent first (for instruction and data bytes).
4. A rising edge on pin \overline{CS} indicates the end of data transmission.

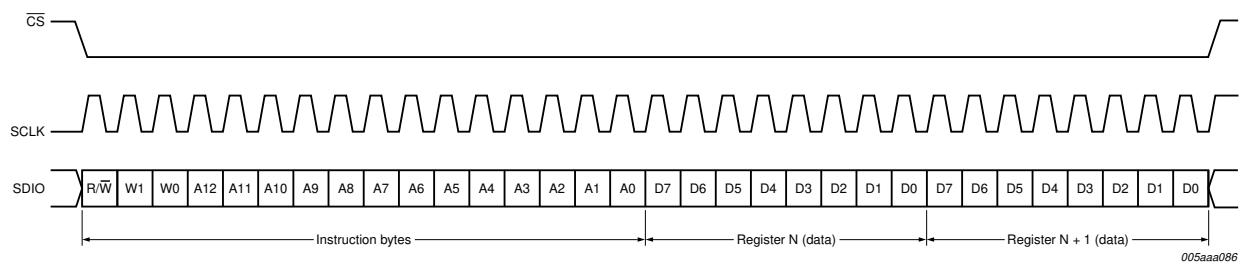

Fig 23. Transfer diagram for two data bytes (3-wire type)

11.6.2 Channel control
