DESCRIPTION

The AIMI0202 passive isolator is used for the electrical isolation and processing of analog 0(4) to 20 mA standard current signals. The AIMI0202 provides electrical isolation between the control electronics and process I/O. In addition, interference signals above 75 Hz are effectively suppressed.

Input and output circuit do not require separate auxiliary power. The AIMI0202 obtains power from the input signal. The modules are snapped onto symmetrical DIN rails in accordance with EN 50022.

VOLTAGE DROP AT INPUT

When using the AIMI0202, ensure the voltage supply is sufficient for handling both the voltage drop of the input and the output load voltage drop. The AIMI0202 input resistance will create around a 1.7 V drop.

The following formula calculates the total voltage drop (input and output). Total voltage drop = (1.7 V + (20 mA * RLOAD))

Where:

1.7 V = Input voltage drop

20 mA * RLOAD = Output load voltage drop

WIRING CONNECTIONS

Connect transducer to input (Terminals 1 & 2), observing polarity. A power supply may be required for loop powered transducers.

The energy for the supply on the input side is taken from the analog input signal. Due to the dynamic input resistance, a power loss of approximately 1.7 V drops at the module input. The module's output is self-powered (active), which is also derived from the input signal.
