

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## DUAL PRECISION CMOS VOLTAGE COMPARATOR WITH PUSH-PULL DRIVER

### GENERAL DESCRIPTION

The ALD2302A/ALD2302 are monolithic precision high performance dual voltage comparators built with advanced silicon gate CMOS technology. The primary features are: very high typical input impedance of  $10^{12}\Omega$ ; low input bias current of  $10\text{pA}$ ; fast response time of  $180\text{ns}$ ; very low power dissipation of  $175\mu\text{A}$  per comparator; and single ( $+5\text{V}$ ) or dual ( $\pm 5\text{V}$ ) power supply operation.

The input voltage range includes ground, which makes these comparators ideal for single supply low level signal detection with high source impedance. The outputs can source and sink current allowing for application flexibility. They can be used in either wired-OR connection without pull-up resistor or push-pull configuration. The ALD2302A/ALD2302 can also be used in wired-OR connection with other open drain circuits such as the ALD2301/ALD2303 voltage comparators.

The ALD2302A/ALD2302 voltage comparators are ideal for a great variety of applications, especially in low level signal detection circuits which require low standby power and high output current. For quad packages, use the ALD4302A/ALD4302 quad voltage comparator.

### APPLICATIONS

- PCMCIA instruments
- MOSFET driver
- High source impedance voltage comparison circuits
- Multiple limit window comparator
- Power supply voltage monitor
- Photodetector sensor circuit
- High speed LED driver
- Oscillators
- Battery operated instruments
- Remote signal detection
- Multiple relay drivers

### BENEFITS

- On-chip input and output buffers
- Precision voltage comparison capability
- Eliminate need for second power supply
- Eliminate pull-up resistor

### FEATURES

- Guaranteed to drive  $200\Omega$  loads
- Fanout of 30LS TTL loads
- Low supply current of  $175\mu\text{A}$  each comparator
- Pinout of LM193 type industry standard comparators
- Extremely low input bias currents -- typically  $10\text{pA}$
- Virtually eliminates source impedance effects
- Low operating supply voltage of  $4\text{V}$  to  $10\text{V}$
- Single ( $+5\text{V}$ ) and dual supply ( $\pm 5\text{V}$ ) operation
- High speed for both large and small signals --  $180\text{ns}$  for TTL inputs and  $400\text{ns}$  for  $20\text{mV}$  overdrive
- CMOS, NMOS and TTL compatible
- Push-pull outputs-current sourcing/ sinking
- High output sinking current -- typically  $60\text{mA}$
- Low supply current spikes
- High gain --  $100\text{V/mV}$

## TYPICAL APPLICATIONS (cont'd)

### PUSH-PULL COMPLEMENTARY POWER MOSFET DRIVER

This circuit eliminates crossover current in the complementary power transistors. The outputs can be used to source and sink different loads or tied together to provide push-pull drive of the same load.

### TIME DELAY GENERATOR

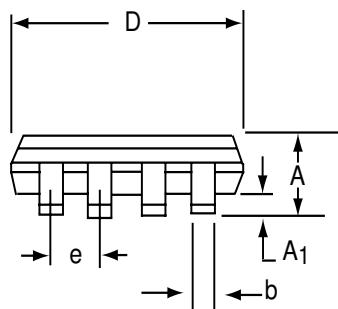

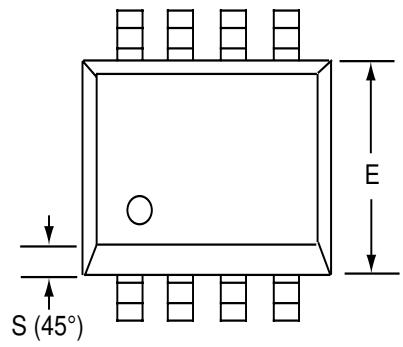

#### Design & Operating Notes:

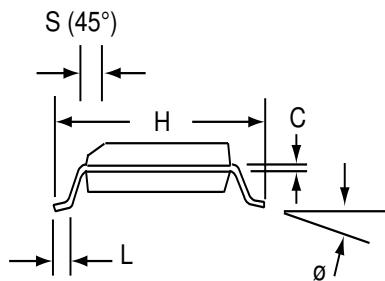

- As each output sources up to 10mA in the output high state, the output stage of a wired - OR low output circuit must be able to sink this current and still provide desired output voltage levels. For TTL output levels, this consideration limits the number to a maximum of three ALD2302 outputs wired-OR together.
- In order to minimize stray oscillation, all unused inputs must be tied to ground.
- The input bias and offset currents are essentially input protection diode reverse bias leakage currents, and are typically less than 1pA at room temperature. The currents are a function of ambient temperature, and would have to be considered in applications where very high source impedance or high accuracy are involved.
- The high output sinking current of 60mA for each output offers flexibility in many applications, as a separate buffer or driver would not be necessary to drive the intended load. However, as the circuit normally operates close to ambient temperature due to its very low power consumption, thermal effects caused by large output current transients must be considered in certain applications.
