

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## 14.5V Input / 300mA Output LDO Regulator

### 1. General Description

The AP1152ADUxx is a low dropout linear regulator with ON/OFF control, which can supply 300mA load current. The IC is an integrated circuit with a silicon monolithic bipolar structure. The output voltage, trimmed with high accuracy, is available from 1.3 to 9.5V in 0.1V steps. The output capacitor is available to use a small 0.1uF ceramic capacitor ( $2.5V \leq V_{out}$ ). The over current, thermal and reverse bias protections are integrated, and also the package is small and high power dissipation type. The IC is designed for space saving requirements.

### 2. Feature

- Available to use a small 0.1uF ceramic capacitor
- Dropout Voltage 105mV at 100mA
- Output Current 300mA Peak 480mA
- High Precision output voltage  $\pm 1.5\%$  or  $\pm 50mV$
- High ripple rejection ratio 80dB at 1kHz
- Wide operating voltage range 2.1V to 14.5V
- Very low quiescent current  $65\mu A$  at  $I_{OUT}=0mA$
- On/Off control (High active)
- Built-in Short circuit protection, thermal shutdown
- Built-in reverse bias over current protection
- Available very low noise application
- Very small surface mount package SOT89-5

### 3. Application

- Any Electronic Equipment
- Battery Powered Systems
- Mobile Communication

■ Pin Configurations

■ Functions

Pin No.	Pin Description	Internal Equivalent Circuit	Description
1	Np		<p>Noise Bypass Terminal</p> <p>Connect a bypass capacitor between GND.</p>
2	GND		GND Terminal
3	V <sub>CONT</sub>		<p>On/Off Control Terminal</p> <p>The pull-down resistor (500kΩ) is built-in.</p>
4	V <sub>IN</sub>		Input Terminal
5	V <sub>OUT</sub>		Output Terminal

### 8. Absolute Maximum Ratings

Parameter	Symbol	min	max	Unit	Condition
Supply Voltage	$V_{CC_{MAX}}$	-0.4	16	V	
Reverse Bias	$V_{rev_{MAX}}$	-0.4	6	V	$V_{out} \leq 2.0V$
		-0.4	12	V	$2.1V \leq V_{out}$
Np Terminal Voltage	$V_{np_{MAX}}$	-0.4	5	V	
Vcont Terminal Voltage	$V_{cont_{MAX}}$	-0.4	16	V	
Junction Temperature	$T_j$	-	150	°C	
Storage Temperature Range	$T_{stg}$	-55	150	°C	
Power Dissipation	$P_D$	-	900	mW	(Note 1)

Note 1. Please do derating with  $7.2mW/^\circ C$  at  $P_d=900mW$  and  $25^\circ C$  or more. Thermal resistance ( $\theta_{JA}$ ) =  $138^\circ C/W$ .

**WARNING:** The maximum ratings are the absolute limitation values with the possibility of the IC breakage. When the operation exceeds this standard quality cannot be guaranteed.

### 9. Recommended Operating Conditions

Parameter	Symbol	min	typ	max	Unit	Condition
Operating Temperature Range	$T_a$	-40	-	85	°C	
Operating Voltage Range	$V_{OP}$	2.1	-	14.5	V	

## 10. Electrical Characteristics

### ■ Electrical Characteristics of Ta=Tj=25°C

The parameters with min or max values will be guaranteed at Ta=Tj=25°C.

( V<sub>IN</sub>=V<sub>out</sub>(typ)+1V, V<sub>cont</sub>=1.8V, Ta=Tj=25°C)

Parameter	Symbol	Condition	min	typ	max	Unit
Output Voltage	V <sub>out</sub>	I <sub>out</sub> = 5mA	(Table 3, Table 4)			V
Line Regulation	LinReg	ΔV <sub>IN</sub> = 5V	-	0.0	6.0	mV
Load Regulation	LoaReg	I <sub>out</sub> = 5mA ~ 100mA	(Table 3, Table 4)			mV
		I <sub>out</sub> = 5mA ~ 200mA				
		I <sub>out</sub> = 5mA ~ 300mA				
Dropout Voltage (Note 2)	V <sub>drop</sub>	I <sub>out</sub> = 100mA	-	105	170	mV
		I <sub>out</sub> = 200mA	-	170	270	
		I <sub>out</sub> = 270mA (2.1V ≤ V <sub>out</sub> ≤ 2.3V)	-	235	370	
		I <sub>out</sub> = 300mA (2.4V ≤ V <sub>out</sub> )	-	235	370	
Maximum Output Current (Note 3)	I <sub>out</sub> MAX	V <sub>out</sub> = V <sub>out</sub> (typ) × 0.9	380	480	-	mA
Short Circuit Current (Note 3)	I <sub>SHORT</sub>		-	500	-	mA
Quiescent Current	I <sub>q</sub>	I <sub>out</sub> = 0mA	-	65	90	μA
Standby Current	I <sub>standby</sub>	V <sub>cont</sub> = 0V	-	0.0	0.1	μA
Ground Terminal Current	I <sub>gnd</sub>	I <sub>out</sub> = 100mA	-	1.8	3.0	mA
V <sub>cont</sub> Terminal						
V <sub>cont</sub> Terminal Current	I <sub>cont</sub>	V <sub>cont</sub> = 1.8V	-	5.0	10.0	μA
V <sub>cont</sub> Terminal Voltage	V <sub>cont</sub>	V <sub>out</sub> ON state	1.8	-	-	V
		V <sub>out</sub> OFF state	-	-	0.35	V

Note 2. For V<sub>out</sub> ≤ 2.0V, no regulations.

Note 3. The maximum output current is limited by power dissipation.

**11. Description**

**11.1 Input / output capacitors**

Linear regulators require input and output capacitors in order to maintain the regulator's loop stability. If a 0.1μF capacitor is connected to the output side, the IC provides stable operation at any voltage in the practical current region. However, increase the CL capacitance when using the IC in the low current region and low voltage. Otherwise, the IC oscillates. The equivalent series resistance (ESR) of the output capacitor must be in the stable operation area. However, it is recommended to use as large a value of capacitance as is practical. The output noise and the ripple noise decrease as the capacitance value increases. ESR values vary widely between ceramic and tantalum capacitors. However, tantalum capacitors are assumed to provide more ESR damping resistance, which provides greater circuit stability. This implies that a higher level of circuit stability can be obtained by using tantalum capacitors when compared to ceramic capacitors with similar values.

The recommended value :  $C_{in}=C_L=0.22\mu F$ (MLCC)  $I_{out} \geq 0.5mA$ .

The input capacitor is necessary when the battery is discharged, the power supply impedance increases, or the line distance to the power supply is long.

This capacitor might be necessary on each individual IC even if two or more regulator ICs are used. Please confirm the stability while mounted. The IC provides stable operation with an output side capacitor of 0.1μF ( $V_{out} \geq 2.5V$ ). If it is 0.1μF or more over the full range of temperature, either a ceramic capacitor or tantalum capacitor can be used without considering ESR. Please confirm stability while mounted.

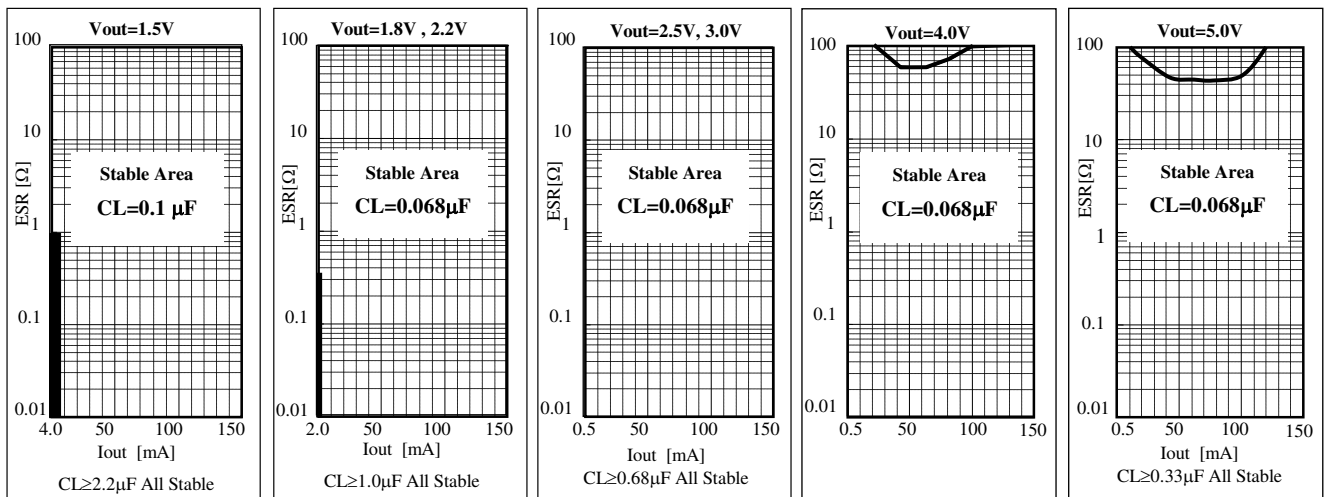

Figure 2. Output voltage, Output current vs. Stable Operation Area

The above graphs show stable operation with a ceramic capacitor of 0.1μF (excluding the low current region). If the capacitance is not increased in the low voltage, low current area, stable operation may not be achieved. Please select the best output capacitor according to the voltage and current used. The stability of the regulator improves if a big output side capacitor is used (the stable operation area extends.) Please use as large a capacitance as is practical. Although operation above 150 mA has not been described, stability is equal to or better than operation at 150 mA.

For evaluation Kyocera :CM05B104K10AB , CM05B224K10AB , CM105B104K16A , CM105B224K16A , CM21B225K10A  
Murata :GRM36B104K10 , GRM42B104K10 , GRM39B104K25 , GRM39B224K10 , GRM39B105K6.3

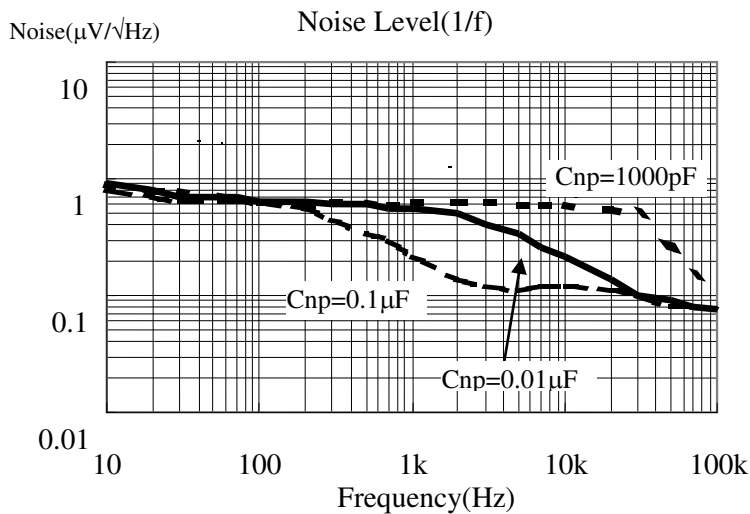

Generally, a ceramic capacitor has both a temperature characteristic and a voltage characteristic. Please consider both characteristics when selecting the part. The B curves are the recommend characteristics.

### 11.2 Output noise

AP1152ADU30 Cnp vs. Noise Iout=30mA BPF=400Hz ~ 80kHz

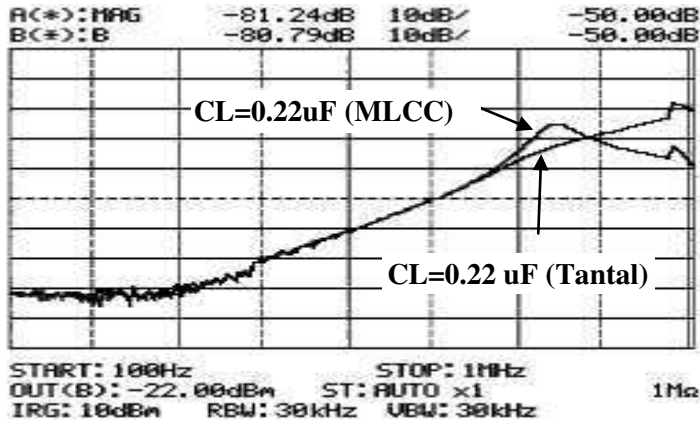

Increase Cnp to decrease the noise. The recommended Cnp capacitance is 6800pF(682) ~ 0.22µF(224). The amount of noise increases with the higher output voltages.

Cin=10µF Iout=10mA  
CL=0.22µF (Ceramic)

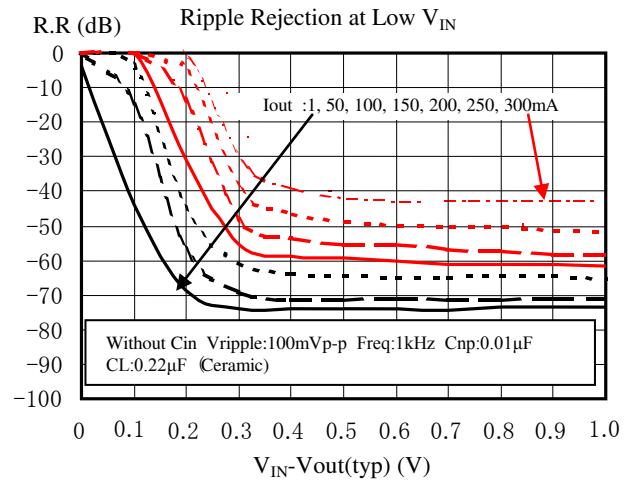

### 11.3 Ripple Rejection

$V_{IN}=5.0V$   $V_{out}=3.0V$   $I_{out}=10mA$   
 $V_R=500mV_{p-p}$   $f=100 \sim 1MHz$   $C_{np}=0.1\mu F$

The ripple rejection characteristic depends on the characteristic and the capacitance value of the capacitor connected to the output side. The RR characteristic of 50KHz or more varies greatly with the capacitor on the output side and PCB pattern. If necessary, please confirm stability while operating.

### 11.4 DC Characteristics

$\Delta V_{out}(mV)$  Line regulation

$\Delta V_{out}(mV)$  Load regulation

$\Delta V_{out}(mV)$  Regulation point

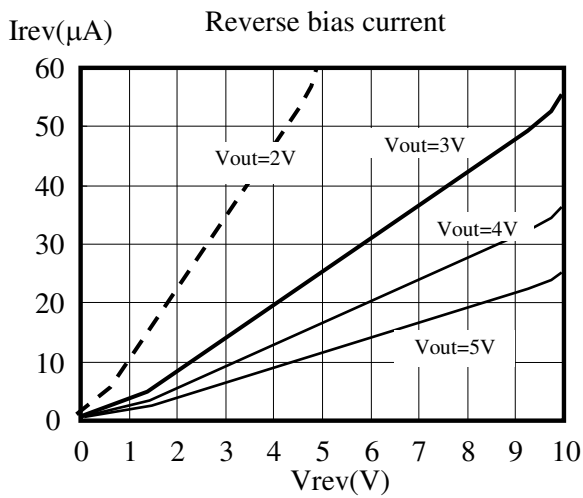

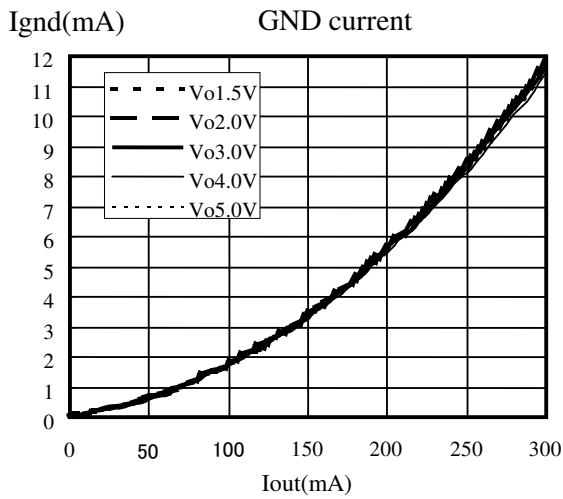

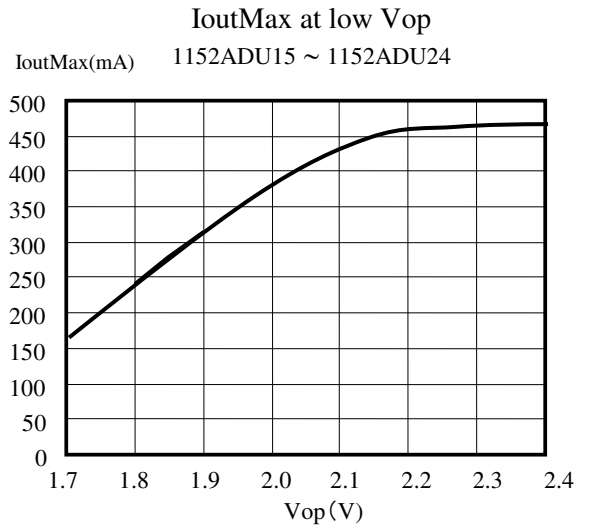

$V_{drop}(mV)$   $V_{drop}$

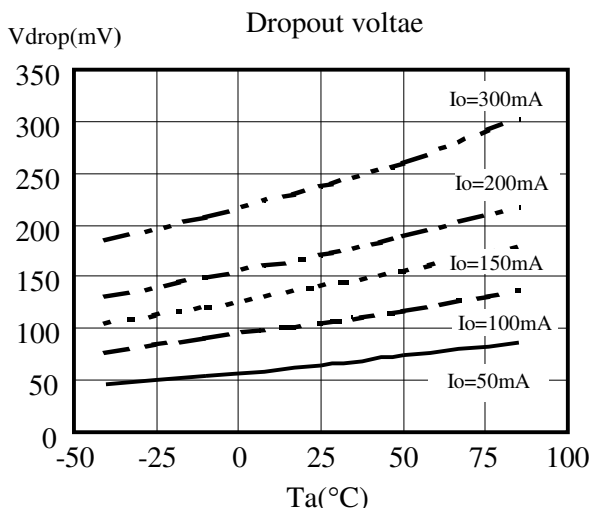

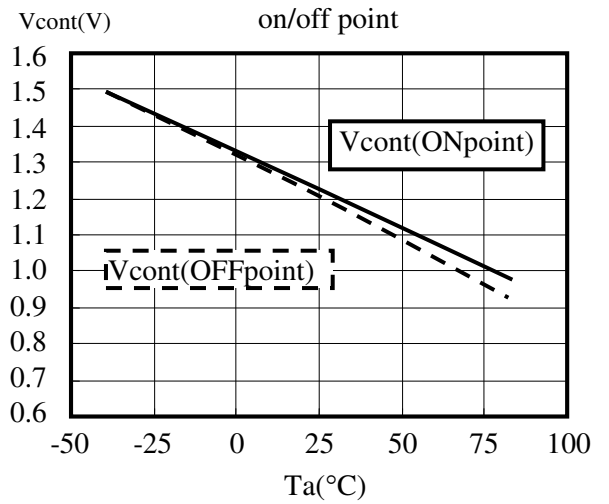

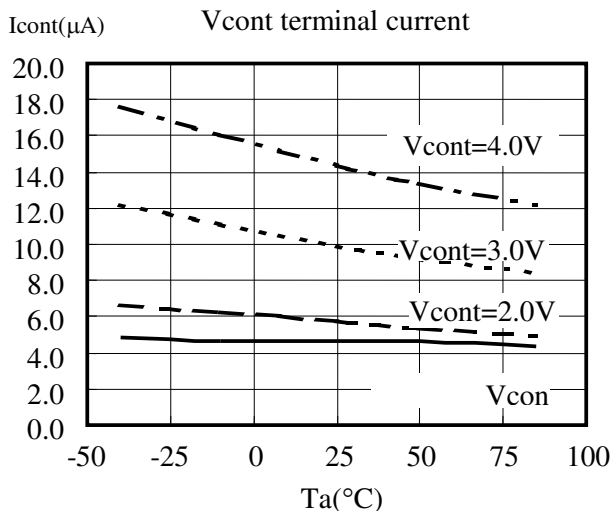

$I_{cont}(\mu A)$   $V_{cont}$  vs.  $I_{cont}$

### 11.5 Temperature Characteristics

• Output voltage vs. Temperature characteristics

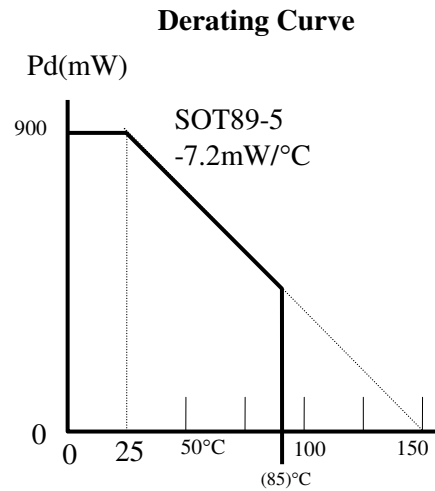

## 11.6 On/Off Control

It is recommended to turn the regulator Off when the circuit following the regulator is non-operating. A design with little electric power loss can be implemented. We recommend the use of the on/off control of the regulator without using a high side switch to provide an output from the regulator. A highly accurate output voltage with low voltage drop is obtained.

Because the  $V_{cont}$  terminal current is small, it is possible to control it directly by CMOS logic. The PULLDOWN resistance ( $500k\Omega$ ) is built into the  $V_{cont}$  terminal. The noise and the ripple rejection characteristics depend on the capacitance on the  $V_{ref}$  terminal. The ripple rejection characteristic of the low frequency region improves by increasing the capacitance of  $C_{np}$ . A standard value is  $C_{np}=0.068\mu F$ . Increase  $C_{np}$  in a design with important output noise and ripple rejection requirements. The IC will not be damaged if the capacitor value is increased. The on/off switching speed changes depending on the  $N_p$  terminal capacitance. The switching speed slows when the capacitance is large.

11.7 PCB Layout

The package loss is limited at the temperature that the internal temperature sensor works (about 150°C). Therefore, the package loss is assumed to be an internal limitation. There is no heat radiation characteristic of the package unit assumed because of the small size. Heat is carried away by the device being installed on the PCB. This value changes by the material and the copper pattern etc. of the PCB. The losses are approximately 900mW(SOT89-5). Enduring these losses becomes possible in a lot of applications operating at 25°C.

**Determining the thermal resistance when mounted on a PCB.**

The operating chip junction temperature is shown by  $T_j = \theta_{ja} \times P_d + T_a$ .  $T_j$  of the IC is set to about 150°C.  $P_d$  is a value when the overtemperature sensor is made to work.

$T_a$  ( $T_a=25^\circ\text{C}$ )  
 $150 = \theta_{ja} \times p_d + 25$   
 $\theta_{ja} \times P_d = 125$   
 $\theta_{ja} = (125 / p_d) (\text{°C} / \text{mW})$

**Pd is easily obtained.**

Mount the IC on the PCB.  $P_d$  becomes  $V_{IN} \times I_{in}$  when the output side of the IC is short-circuited. The input current decreases gradually by the temperature rise of the chip. Please use the value when the current is steady (thermal equilibrium is reached). In many cases, heat radiation is good, and  $P_d$  becomes 900 mW or more.

$P_d$  is obtained by the normal temperature in degrees. The current that can be used at the highest operating temperature is obtained from the graph of the figure below.

The maximum current that can be used at the highest operating temperature is:

$$I_{out} \cong DP_d \div (V_{IN(max)} - V_{out}).$$

## 12. Definition of term

- **Output Voltage (Vout)**

The output voltage is specified with  $V_{IN}=(V_{out}(typ)+1V)$  and  $I_{out}=5mA$ .

- **Maximum Output Current (Iout MAX)**

The rated output current is specified under the condition where the output voltage drops 0.3V the value specified with  $I_{out}=5mA$ . The input voltage is set to  $V_{out}(typ)+1V$  and the current is pulsed to minimize temperature effect.

- **Dropout Voltage (Vdrop)**

The dropout voltage is the difference between the input voltage and the output voltage at which point the regulator starts to fall out of regulation. Below this value, the output voltage will fall as the input voltage is reduced. It is dependent upon the load current and the junction temperature.

- **Line Regulation (LinReg)**

Line regulation is the ability of the regulator to maintain a constant output voltage as the input voltage changes. The line regulation is specified as the input voltage is changed from  $V_{IN}=V_{out}(typ)+1V$  to  $V_{IN}=V_{out}(typ)+6V$ . It is a pulse measurement to minimize temperature effect.

- **Load Regulation (LoaReg)**

Load regulation is the ability of the regulator to maintain a constant output voltage as the load current changes. It is a pulsed measurement to minimize temperature effects with the input voltage set to  $V_{IN}=V_{out}(typ)+1V$ . The load regulation is specified output current step conditions of 5mA to 100mA.

- **Ripple Rejection (R.R)**

Ripple rejection is the ability of the regulator to attenuate the ripple content of the input voltage at the output. It is specified with  $200mV_{rms}$ , 1kHz super-imposed on the input voltage, where  $V_{IN}=V_{out}+1.5V$ . Ripple rejection is the ratio of the ripple content of the output vs. input and is expressed in dB.

- **Standby Current (Istandby)**

Standby current is the current, which flows into the regulator when the output is turned off by the control function ( $V_{cont}=0V$ ).

- **Over Current Sensor**

The over current sensor protects the device when there is excessive output current. It also protects the device if the output is accidentally connected to ground.

- **Thermal Sensor**

The thermal sensor protects the device in case the junction temperature exceeds the safe value ( $T_J=150^{\circ}C$ ). This temperature rise can be caused by external heat, excessive power dissipation caused by large input to output voltage drops, or excessive output current. The regulator will shut off when the temperature exceeds the safe value. As the junction temperatures decrease, the regulator will begin to operate again. Under sustained fault conditions, the regulator output will oscillate as the device turns off then resets. Damage may occur to the device under extreme fault.

Please reduce the loss of the regulator when this protection operate, by reducing the input voltage or make better heat efficiency. In the case that the power,  $V_{IN} \times I_{short}$ (Short Circuit Current), becomes more than twice of the maximum rating of its power dissipation in a moment, there is a possibility that the IC is destroyed before internal thermal protection works.

- **Reverse Voltage Protection**

Reverse voltage protection prevents damage due to the output voltage being higher than the input voltage. This fault condition can occur when the output capacitor remains charged and the input is reduced to zero, or when an external voltage higher than the input voltage is applied to the output side

**13. Recommended External Circuits**
