

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

**Revision History****AS4C16M16D1A - 66-pin TSOPII PACKAGE**

Revision	Details	Date
Rev 1.1	Preliminary datasheet	July 2015
Rev 1.2	Production Released	Aug 2015

## Features

- Fast clock rate: 200MHz
- Differential Clock CK &  $\overline{CK}$
- Bi-directional DQS
- DLL enable/disable by EMRS
- Fully synchronous operation
- Internal pipeline architecture
- Four internal banks, 4M x 16-bit for each bank
- Programmable Mode and Extended Mode registers
  - CAS Latency: 2, 2.5, 3
  - Burst length: 2, 4, 8
  - Burst Type: Sequential & Interleaved
- Individual byte write mask control
- DM Write Latency = 0
- Auto Refresh and Self Refresh
- 8192 refresh cycles / 64ms
- Precharge & active power down
- Power supplies: VDD & VDDQ = 2.5V  $\pm$  0.2V
- Interface: SSTL\_2 I/O Interface
- Operating Temperature:
  - Commercial (0°C~70°C)
  - Industrial (-40°C~85°C)
- Package: 66 Pin TSOP II, 0.65mm pin pitch
  - Pb free and Halogen free

## Overview

The AS4C16M16D1 SDRAM is a high-speed CMOS double data rate synchronous DRAM containing 256 Mbits. It is internally configured as a quad 4M x 16 DRAM with a synchronous interface (all signals are registered on the positive edge of the clock signal, CK). Data outputs occur at both rising edges of CK and  $\overline{CK}$ . Read and write accesses to the SDRAM are burst oriented; accesses start at a selected location and continue for a programmed number of locations in a programmed sequence. Accesses begin with the registration of a BankActivate command which is then followed by a Read or Write command. The AS4C16M16D1 provides programmable Read or Write burst lengths of 2, 4, or 8. An auto precharge function may be enabled to provide a self-timed row precharge that is initiated at the end of the burst sequence. The refresh functions, either Auto or Self Refresh are easy to use. In addition, AS4C16M16D1 features programmable DLL option. By having a programmable mode register and extended mode register, the system can choose the most suitable modes to maximize its performance. These devices are well suited for applications requiring high memory band-width, result in a device particularly well suited to high performance main memory and graphics applications.

**Table 1. Ordering Information**

Product part No	Clock	Temperature	Data Rate	Package
AS4C16M16D1A-5TCN	200MHz	Commercial 0°C to 70°C	400Mbps/pin	66pin TSOPII
AS4C16M16D1A-5TIN	200MHz	Industrial -40°C to 85°C	400Mbps/pin	66pin TSOPII

## Pin Descriptions

**Table 2. Pin Details**

Symbol	Type	Description
CK, $\overline{CK}$	Input	<b>Differential Clock:</b> CK, $\overline{CK}$ are driven by the system clock. All SDRAM input signals are sampled on the positive edge of CK. Both CK and $\overline{CK}$ increment the internal burst counter and controls the output registers.
CKE	Input	<b>Clock Enable:</b> CKE activates (HIGH) and deactivates (LOW) the CK signal. If CKE goes low synchronously with clock, the internal clock is suspended from the next clock cycle and the state of output and burst address is frozen as long as the CKE remains low. When all banks are in the idle state, deactivating the clock controls the entry to the Power Down and Self Refresh modes.
BA0, BA1	Input	<b>Bank Activate:</b> BA0 and BA1 define to which bank the BankActivate, Read, Write, or BankPrecharge command is being applied.
A0-A12	Input	<b>Address Inputs:</b> A0-A12 are sampled during the BankActivate command (row address A0-A12) and Read/Write command (column address A0-A8 with A10 defining Auto Precharge).
$\overline{CS}$	Input	<b>Chip Select:</b> $\overline{CS}$ enables (sampled LOW) and disables (sampled HIGH) the command decoder. All commands are masked when $\overline{CS}$ is sampled HIGH. $\overline{CS}$ provides for external bank selection on systems with multiple banks. It is considered part of the command code.
$\overline{RAS}$	Input	<b>Row Address Strobe:</b> The $\overline{RAS}$ signal defines the operation commands in conjunction with the $\overline{CAS}$ and $\overline{WE}$ signals and is latched at the positive edges of CK. When $\overline{RAS}$ and $\overline{CS}$ are asserted "LOW" and $\overline{CAS}$ is asserted "HIGH," either the BankActivate command or the Precharge command is selected by the $\overline{WE}$ signal. When the $\overline{WE}$ is asserted "HIGH," the BankActivate command is selected and the bank designated by BA is turned on to the active state. When the $\overline{WE}$ is asserted "LOW," the Precharge command is selected and the bank designated by BA is switched to the idle state after the precharge operation.
$\overline{CAS}$	Input	<b>Column Address Strobe:</b> The $\overline{CAS}$ signal defines the operation commands in conjunction with the $\overline{RAS}$ and $\overline{WE}$ signals and is latched at the positive edges of CK. When $\overline{RAS}$ is held "HIGH" and $\overline{CS}$ is asserted "LOW," the column access is started by asserting $\overline{CAS}$ "LOW." Then, the Read or Write command is selected by asserting $\overline{WE}$ "HIGH" or "LOW".
$\overline{WE}$	Input	<b>Write Enable:</b> The $\overline{WE}$ signal defines the operation commands in conjunction with the $\overline{RAS}$ and $\overline{CAS}$ signals and is latched at the positive edges of CK. The $\overline{WE}$ input is used to select the BankActivate or Precharge command and Read or Write command.
LDQS, UDQS	Input / Output	<b>Bidirectional Data Strobe:</b> Specifies timing for Input and Output data. Read Data Strobe is edge triggered. Write Data Strobe provides a setup and hold time for data and DQM. LDQS is for DQ0~7, UDQS is for DQ8~15.
LDM, UDM	Input	<b>Data Input Mask:</b> Input data is masked when DM is sampled HIGH during a write cycle. LDM masks DQ0-DQ7, UDM masks DQ8-DQ15.
DQ0 - DQ15	Input / Output	<b>Data I/O:</b> The DQ0-DQ15 input and output data are synchronized with positive and negative edges of LDQS and UDQS. The I/Os are byte-maskable during Writes.

---

---

V <sub>DD</sub>	Supply	<b>Power Supply:</b> 2.5V ± 0.2V .
V <sub>SS</sub>	Supply	<b>Ground</b>
V <sub>DDQ</sub>	Supply	<b>DQ Power:</b> 2.5V ± 0.2V. Provide isolated power to DQs for improved noise immunity.
V <sub>SSQ</sub>	Supply	<b>DQ Ground:</b> Provide isolated ground to DQs for improved noise immunity.
V <sub>REF</sub>	Supply	<b>Reference Voltage for Inputs:</b> +0.5*V <sub>DDQ</sub>
NC	-	<b>No Connect:</b> These pins should be left unconnected.

## Operation Mode

Fully synchronous operations are performed to latch the commands at the positive edges of CK. Table 3 shows the truth table for the operation commands.

**Table 3. Truth Table (Note (1), (2))**

Command	State	CKE <sub>n-1</sub>	CKE <sub>n</sub>	DM	BA <sub>0,1</sub>	A10	A0-9, 11-12	CS	RAS	CAS	WE
BankActivate	Idle <sup>(3)</sup>	H	X	X	V	Row address		L	L	H	H

								L	H	H	H
Precharge Power Down Mode Exit	Any (PowerDown)	L	H	X	X	X	X	H	X	X	X
								L	H	H	H
Active Power Down Mode Entry	Active	H	L	X	X	X	X	H	X	X	X
								L	V	V	V
Active Power Down Mode Exit	Any (PowerDown)	L	H	X	X	X	X	H	X	X	X
								L	H	H	H
Data Input Mask Disable	Active	H	X	L	X	X	X	X	X	X	X
Data Input Mask Enable <sup>(5)</sup>	Active	H	X	H	X	X	X	X	X	X	X

- Note:**
1. V=Valid data, X=Don't Care, L=Low level, H=High level
  2. CKE<sub>n</sub> signal is input level when commands are provided.  
CKE<sub>n-1</sub> signal is input level one clock cycle before the commands are provided.
  3. These are states of bank designated by BA signal.
  4. Device state is 2, 4, and 8 burst operation.
  5. LDM and UDM can be enabled respectively.

## Mode Register Set (MRS)

The Mode Register stores the data for controlling various operating modes of a DDR SDRAM. It programs CAS Latency, Burst Type, and Burst Length to make the DDR SDRAM useful for a variety of applications. The default value of the Mode Register is not defined; therefore the Mode Register must be written by the user. Values stored in the register will be retained until the register is reprogrammed. The Mode Register is written by asserting Low on  $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{CAS}$ ,  $\overline{WE}$ , BA1 and BA0 (the device should have all banks idle with no bursts in progress prior to writing into the mode register, and CKE should be High). The state of address pins A0~A12 and BA0, BA1 in the same cycle in which  $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{CAS}$  and  $\overline{WE}$  are asserted Low is written into the Mode Register. A minimum of two clock cycles, tMRD, are required to complete the write operation in the Mode Register. The Mode Register is divided into various fields depending on functionality. The Burst Length uses A0~A2, Burst Type uses A3, and CAS Latency (read latency from column address) uses A4~A6. A logic 0 should be programmed to all the undefined addresses to ensure future compatibility. Reserved states should not be used to avoid unknown device operation or incompatibility with future versions. Refer to the table for specific codes for various burst lengths, burst types and CAS latencies.

**Table 4. Mode Register Bitmap**

- Burst Length Field (A2~A0)

This field specifies the data length of column access using the A2~A0 pins and selects the Burst Length to be 2, 4, 8.

**Table 5. Burst Length**

A2	A1	A0	Burst Length
0	0	0	Reserved
0	0	1	2
0	1	0	4
0	1	1	8
1	0	0	Reserved
1	0	1	Reserved
1	1	0	Reserved
1	1	1	Reserved

- Addressing Mode Select Field (A3)

The Addressing Mode can be one of two modes, either Interleave Mode or Sequential Mode. Both Sequential Mode and Interleave Mode support burst length of 2, 4 and 8.

**Table 6. Addressing Mode**

A3	Addressing Mode
0	Sequential
1	Interleave

- Burst Definition, Addressing Sequence of Sequential and Interleave Mode

**Table 7. Burst Address ordering**

Burst Length	Start Address			Sequential	Interleave
	A2	A1	A0		
2	X	X	0	0, 1	0, 1
	X	X	1	1, 0	1, 0
4	X	0	0	0, 1, 2, 3	0, 1, 2, 3
	X	0	1	1, 2, 3, 0	1, 0, 3, 2
	X	1	0	2, 3, 0, 1	2, 3, 0, 1
	X	1	1	3, 0, 1, 2	3, 2, 1, 0
8	0	0	0	0, 1, 2, 3, 4, 5, 6, 7	0, 1, 2, 3, 4, 5, 6, 7
	0	0	1	1, 2, 3, 4, 5, 6, 7, 0	1, 0, 3, 2, 5, 4, 7, 6
	0	1	0	2, 3, 4, 5, 6, 7, 0, 1	2, 3, 0, 1, 6, 7, 4, 5
	0	1	1	3, 4, 5, 6, 7, 0, 1, 2	3, 2, 1, 0, 7, 6, 5, 4
	1	0	0	4, 5, 6, 7, 0, 1, 2, 3	4, 5, 6, 7, 0, 1, 2, 3
	1	0	1	5, 6, 7, 0, 1, 2, 3, 4	5, 4, 7, 6, 1, 0, 3, 2
	1	1	0	6, 7, 0, 1, 2, 3, 4, 5	6, 7, 4, 5, 2, 3, 0, 1
	1	1	1	7, 0, 1, 2, 3, 4, 5, 6	7, 6, 5, 4, 3, 2, 1, 0

- CAS Latency Field (A6~A4)

This field specifies the number of clock cycles from the assertion of the Read command to the first read data. The minimum whole value of CAS Latency depends on the frequency of CK. The minimum whole value satisfying the following formula must be programmed into this field.  $t_{CAC}(\min) \leq \text{CAS Latency} \times t_{CK}$

**Table 8. CAS Latency**

A6	A5	A4	CAS Latency
0	0	0	Reserved
0	0	1	Reserved
0	1	0	2 clocks
0	1	1	3 clocks
1	0	0	Reserved
1	0	1	Reserved
1	1	0	2.5 clocks
1	1	1	Reserved

- Test Mode field (A8~A7)

These two bits are used to enter the test mode and must be programmed to "00" in normal operation.

**Table 9. Test Mode**

A8	A7	Test Mode
0	0	Normal mode
1	0	DLL Reset

- (BA0, BA1)

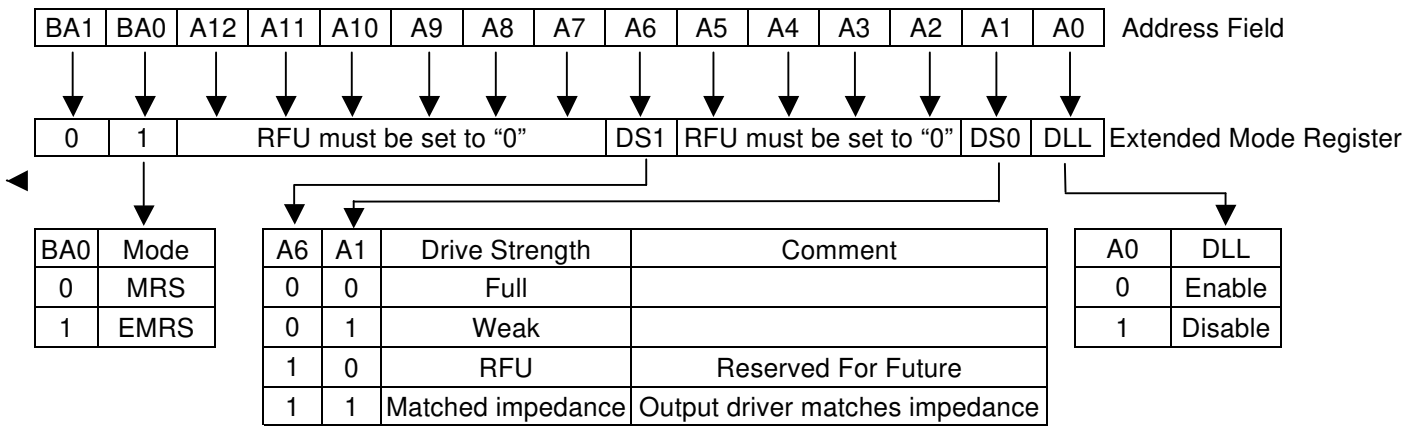

**Table 10. MRS/EMRS**

BA1	BA0	A12 ~ A0
RFU	0	MRS Cycle
RFU	1	Extended Functions (EMRS)

## Extended Mode Register Set (EMRS)

The Extended Mode Register Set stores the data for enabling or disabling DLL and selecting output driver strength. The default value of the extended mode register is not defined, therefore must be written after power up for proper operation. The extended mode register is written by asserting low on  $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{CAS}$ , and  $\overline{WE}$ . The state of A0 ~ A12, BA0 and BA1 is written in the mode register in the same cycle as  $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{CAS}$ , and  $\overline{WE}$  going low. (the device should have all banks idle with no bursts in progress prior to writing into the mode register, and CKE should be High). A1 is used for setting driver strength to normal, or weak. Two clock cycles are required to complete the write operation in the extended mode register. The mode register contents can be changed using the same command and clock cycle requirements during operation as long as all banks are in the idle state. A0 is used for DLL enable or disable. "High" on BA0 is used for EMRS. Refer to the table for specific codes.

**Table 11. Extended Mode Register Bitmap**

**Table 12. Absolute Maximum Rating**

Symbol	Item	Rating	Unit	
V <sub>IN</sub> , V <sub>OUT</sub>	Input, Output Voltage	- 0.5~ V <sub>DDQ</sub> + 0.5	V	
V <sub>DD</sub> , V <sub>DDQ</sub>	Power Supply Voltage	- 1~3.6	V	
T <sub>A</sub>	Ambient Temperature	Commercial	0~70	°C
		Industrial	-40~85	°C
T <sub>STG</sub>	Storage Temperature	-55~150	°C	
T <sub>SOLDER</sub>	Soldering Temperature	260	°C	
P <sub>D</sub>	Power Dissipation	1	W	
I <sub>OS</sub>	Short Circuit Output Current	50	mA	

Note1: Stress greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device.

Note2: These voltages are relative to V<sub>SS</sub>

**Table 13. Recommended D.C. Operating Conditions (V<sub>DD</sub> = 2.5V ± 0.2V, T<sub>A</sub> = -40~85 °C)**

Symbol	Parameter	Min.	Max.	Unit	Note
V <sub>DD</sub>	Power Supply Voltage	2.3	2.7	V	
V <sub>DDQ</sub>	Power Supply Voltage (for I/O Buffer)	2.3	2.7	V	
V <sub>REF</sub>	Input Reference Voltage	0.49*V <sub>DDQ</sub>	0.51* V <sub>DDQ</sub>	V	
V <sub>IH</sub> (DC)	Input High Voltage (DC)	V <sub>REF</sub> + 0.15	V <sub>DDQ</sub> + 0.3	V	
V <sub>IL</sub> (DC)	Input Low Voltage (DC)	-0.3	V <sub>REF</sub> - 0.15	V	
V <sub>TT</sub>	Termination Voltage	V <sub>REF</sub> - 0.04	V <sub>REF</sub> + 0.04	V	
V <sub>IN</sub> (DC)	Input Voltage Level, CK and $\overline{CK}$ inputs	-0.3	V <sub>DDQ</sub> + 0.3	V	
V <sub>ID</sub> (DC)	Input Different Voltage, CK and $\overline{CK}$ inputs	0.36	V <sub>DDQ</sub> + 0.6	V	
I <sub>I</sub>	Input leakage current	-2	2	μA	
I <sub>OZ</sub>	Output leakage current	-5	5	μA	
I <sub>OH</sub>	Output High Current	-16.2	-	mA	V <sub>OH</sub> = 1.95V
I <sub>OL</sub>	Output Low Current	16.2	-	mA	V <sub>OL</sub> = 0.35V

Note: All voltages are referenced to V<sub>SS</sub>.

**Table 14. Capacitance (V<sub>DD</sub> = 2.5V, f = 1MHz, T<sub>A</sub> = 25 °C)**

Symbol	Parameter	Min.	Max.	Unit
C <sub>IN1</sub>	Input Capacitance (CK, $\overline{CK}$ )	2	3	pF
C <sub>IN2</sub>	Input Capacitance (All other input-only pins)	2	3	pF
C <sub>I/O</sub>	DQ, DQS, DM Input/Output Capacitance	4	5	pF

Note: These parameters are guaranteed by design, periodically sampled and are not 100% tested

**Table 17. Recommended A.C. Operating Conditions** ( $V_{DD} = 2.5V \pm 0.2V$ ,  $T_A = -40 \sim 85 \text{ }^\circ\text{C}$ )

Symbol	Parameter	Min.	Max.	Unit
$V_{IH}$ (AC)	Input High Voltage (AC)	$V_{REF} + 0.31$	-	V
$V_{IL}$ (AC)	Input Low Voltage (AC)	-	$V_{REF} - 0.31$	V
$V_{ID}$ (AC)	Input Different Voltage, CK and $\overline{CK}$ inputs	0.7	$V_{DDQ} + 0.6$	V
$V_{IX}$ (AC)	Input Crossing Point Voltage, CK and $\overline{CK}$ inputs	$0.5 * V_{DDQ} - 0.2$	$0.5 * V_{DDQ} + 0.2$	V

**Note:**

- 1) Enables on-chip refresh and address counters.
- 2)  $\text{Min}(t_{CL}, t_{CH})$  refers to the smaller of the actual clock low time and actual clock high time as provided to the device.
- 3)  $t_{HZ}$  and  $t_{LZ}$  transitions occur in the same access time windows as valid data transitions. These parameters are not referenced to a specific voltage level, but specify when the device output is no longer driving(HZ), or begins driving(LZ).
- 4) The specific requirement is that DQS be valid (High, Low, or at some point on a valid transition) on or before this CK edge. A valid transition is defined as monotonic, and meeting the input slew rate specifications of the device. When no writes were previously in progress on the bus, DQS will be transitioning from High-Z to logic LOW. If a previous write was in progress, DQS could be HIGH, LOW, or transitioning from HIGH to LOW at this time, depending on  $t_{DQSS}$ .
- 5) The maximum limit for this parameter is not a device limit. The device will operate with a greater value for this parameter, but system performance (bus turnaround) will degrade accordingly.
- 6) For command/address slew rate  $\geq 0.5V/ns$  and  $< 1.0V/ns$ . For CK &  $\overline{CK}$  slew rate  $\geq 1.0V/ns$ .
- 7) A maximum of eight AUTO REFRESH commands can be posted to any given DDR SDRAM device.
- 8) Power-up sequence is described in Note 10
- 9) A.C. Test Conditions

**Table 18. SSTL\_2 Interface**

Reference Level of Output Signals ( $V_{REF}$ )	$0.5 * V_{DDQ}$
Output Load	Reference to the Test Load
Input Signal Levels	$V_{REF} + 0.31 \text{ V} / V_{REF} - 0.31 \text{ V}$
Input Signals Slew Rate	1 V/ns
Reference Level of Input Signals	$0.5 * V_{DDQ}$

Figure 3. SSTL\_2 A.C. Test Load

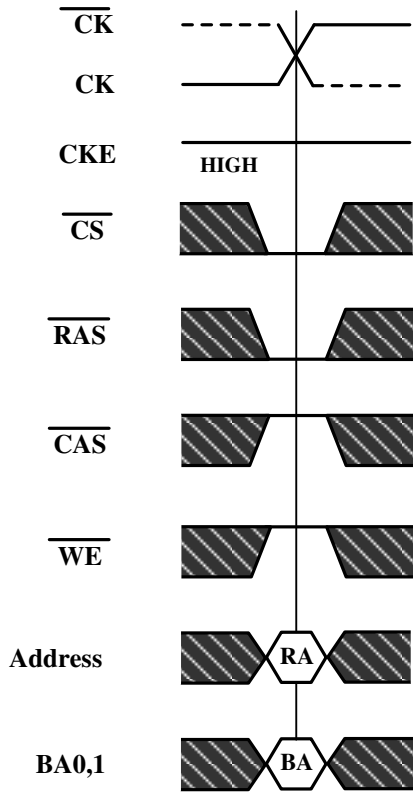

## 10) Power up Sequence

Power up must be performed in the following sequence.

- 1) Apply power to  $V_{DD}$  before or at the same time as  $V_{DDQ}$ ,  $V_{TT}$  and  $V_{REF}$  when all input signals are held "NOP" state and maintain CKE "LOW".
- 2) Start clock and maintain stable condition for minimum 200 $\mu$ s.
- 3) Issue a "NOP" command and keep CKE "HIGH"
- 4) Issue a "Precharge All" command.
- 5) Issue EMRS – enable DLL.
- 6) Issue MRS – reset DLL. (An additional 200 clock cycles are required to lock the DLL).
- 7) Precharge all banks of the device.
- 8) Issue two or more Auto Refresh commands.
- 9) Issue MRS – with A8 to low to initialize the mode register.
