

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

AS5147P

14-Bit On-Axis Magnetic Rotary Position Sensor with 12-Bit Binary Incremental Pulse Count and for 28krpm High Speed Capability

General Description

The AS5147P is a high-resolution rotary position sensor for high speed (up to 28krpm) angle measurement over a full 360 degree range. This new position sensor is equipped with a revolutionary integrated dynamic angle error compensation (DAEC™) with almost 0 latency.

The robust design of the device suppresses the influence of any homogenous external stray magnetic field. A standard 4-wire SPI serial interface allows a host microcontroller to read 14-bit absolute angle position data from the AS5147P and to program non-volatile settings without a dedicated programmer. Incremental movements are indicated on a set of ABI signals with a maximum resolution of 4096 steps / 1024 pulses per revolution. The resolution of ABI signal is programmable to 4096 steps / 1024 pulses per revolution, 2048 steps / 512 pulses per revolution or 1024 steps / 256 pulses per revolution. Brushless DC (BLDC) motors are controlled through a standard UVW commutation interface with a programmable number of pole pairs from 1 to 7. The absolute angle position is also provided as PWM-encoded output signal.

The AS5147P supports embedded self-diagnostics including magnetic field strength too high, magnetic field strength too low or lost magnet, and other related diagnostic features.

The product is defined as SEooC (Safety Element out of Context) according to ISO26262 including FMEDA, safety manual and third party qualification.

The AS5147P is available as a single die in a compact 14-pin TSSOP package.

[Ordering Information and Content Guide](#) appear at end of datasheet.

Key Benefits & Features

The benefits and features of AS5147P, 14-Bit On-Axis Magnetic Rotary Position Sensor with 12-Bit Binary Incremental Pulse Count and for 28krpm High Speed Capability are listed below:

Figure 1:
Added Value of Using the AS5147P

Benefits	Features
<ul style="list-style-type: none"> • High speed application 	<ul style="list-style-type: none"> • Up to 28krpm
<ul style="list-style-type: none"> • Easy to use – saving costs on DSP 	<ul style="list-style-type: none"> • DAEC™ Dynamic angle error compensation
<ul style="list-style-type: none"> • Good resolution for motor and position control 	<ul style="list-style-type: none"> • 14-bit core resolution
<ul style="list-style-type: none"> • Versatile choice of the interface 	<ul style="list-style-type: none"> • Independent output interfaces: SPI, ABI, UVW, PWM
<ul style="list-style-type: none"> • No programmer needed (via SPI command) 	<ul style="list-style-type: none"> • Zero position, configuration programmable
<ul style="list-style-type: none"> • Supports safety challenging applications 	<ul style="list-style-type: none"> • Self-Diagnostics
<ul style="list-style-type: none"> • Lower system costs (no shielding) 	<ul style="list-style-type: none"> • Immune to external stray field

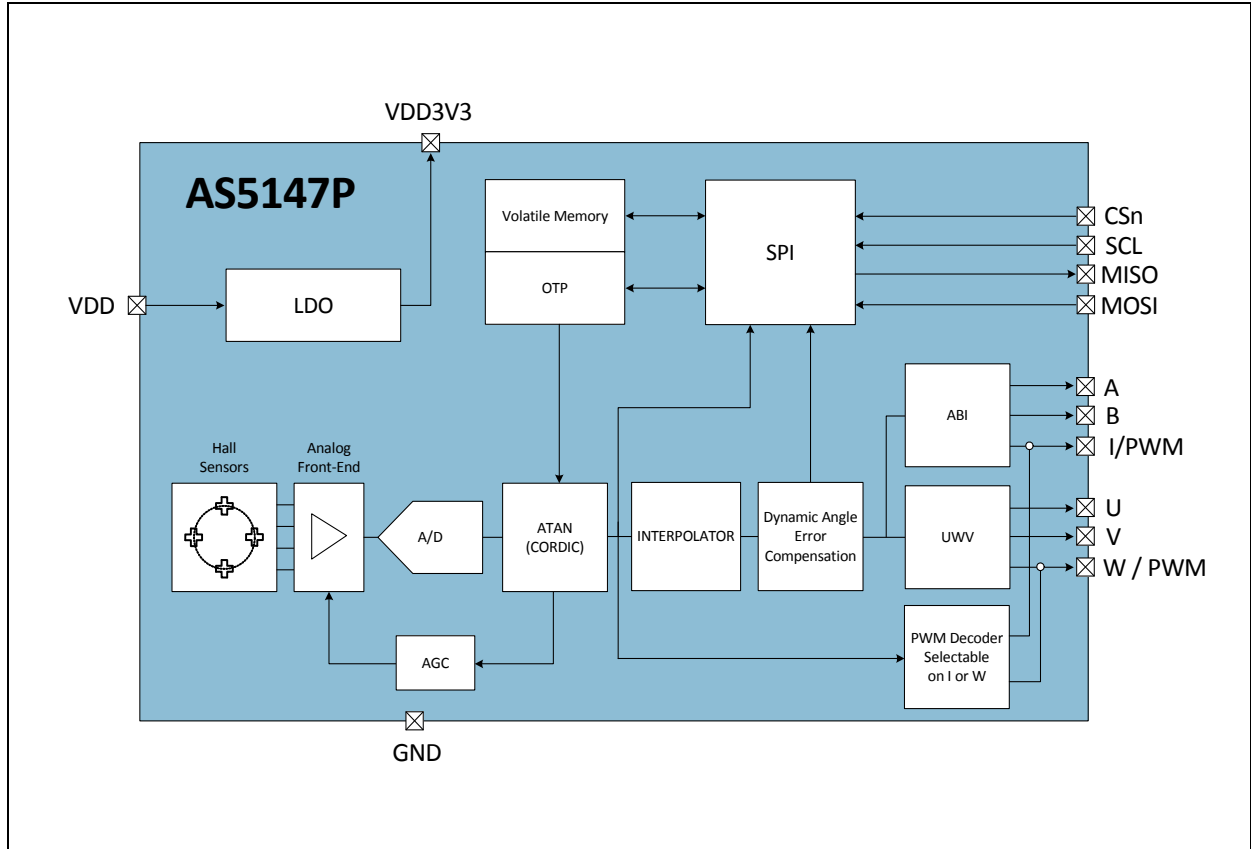

Applications

The AS5147P has been designed to support BLDC motor commutation for the most challenging automotive applications (AEC-Q100 grade 0 automotive qualified) such as electric power steering (EPS), transmission (gearbox, actuator), pump, brake (actuator) and starter and alternator.

Block Diagram

The functional blocks of this device are shown below:

Figure 2:
AS5147P Block Diagram

Pin Assignment

Figure 3:
TSSOP-14 Pin Assignment

Figure 4:
Pin Description

Pin Number	Pin Name	Pin Type	Description
1	CSn	Digital input	SPI chip select (active low)
2	CLK	Digital input	SPI clock
3	MISO	Digital output	SPI master data input, slave output
4	MOSI	Digital input	SPI master data output, slave input
5	Test		Test pin (connect to ground)
6	B	Digital output	Incremental signal B
7	A	Digital output	Incremental signal A

Pin Number	Pin Name	Pin Type	Description
8	W/PWM	Digital output	Commutation signal W or PWM-encoded output
9	V	Digital output	Commutation signal V
10	U	Digital output	Commutation signal U
11	VDD	Power supply	5V power supply voltage for on-chip regulator
12	VDD3V3	Power supply	3.3V on-chip low-dropout (LDO) output. Requires an external decoupling capacitor (1 μ F)
13	GND	Power supply	Ground
14	I	Digital output	Incremental signal I (index) or PWM

Note(s):

1. Floating state of a digital input is not allowed.
2. If SPI is not used, a Pull up resistor on CSn is required.
3. If SPI is not used, a Pull down resistor on CLK and MOSI is required.
4. If SPI is not used, the pin MISO can be left open.
5. If ABI, UVW or PWM is not used, the pins can be left open.

Absolute Maximum Ratings

Stresses beyond those listed parameters under [Absolute Maximum Ratings](#) may cause permanent damage to the device. These are stress ratings only. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Parameters regarding normal operation of the sensor are listed in section [Electrical Characteristics](#).

Figure 5:
Absolute Maximum Ratings

Symbol	Parameter	Min	Max	Units	Note
VDD5	DC supply voltage at VDD pin	-0.3	7.0	V	
VDD3	DC supply voltage at VDD3V3 pin	-0.3	5.0	V	
V _{SS}	DC supply voltage at GND pin	-0.3	0.3	V	
V _{in}	Input pin voltage		VDD+0.3	V	
I _{scr}	Input current (latch-up immunity)	-100	100	mA	AEC-Q100-004
ESD	Electrostatic discharge	±2		kV	AEC-Q100-002
P _t	Total power dissipation (all supplies and outputs)		150	mW	
Ta5V0	Ambient temperature 5V0	-40	150	°C	In the 5.0V power supply mode only
Ta3V3	Ambient temperature 3V3	-40	125	°C	In the 3.3V power supply mode if <code>NOISESET = 0</code>
TaProg	Programming temperature	5	45	°C	Programming @ room temperature (25°C ± 20°C)
T _{strg}	Storage temperature	-55	150	°C	
T _{body}	Package body temperature		260	°C	IPC/JEDEC J-STD-020
RH _{NC}	Relative humidity non-condensing	5	85	%	
MSL	Moisture sensitivity level	3			Represents a maximum floor lifetime of 168h

Electrical Characteristics

All limits are guaranteed. The parameters with min and max values are guaranteed with production tests or SQC (Statistical Quality Control) methods.

Figure 6:
Electrical Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Units
VDD	Positive supply voltage	5.0V operation mode	4.5	5.0	5.5	V
VDD3V3	Positive supply voltage	3.3V operation mode; only from -40 to 125°C	3.0	3.3	3.6	V
VDD3V3_150	Positive supply voltage	3.3V operation mode; only from -40 to 150°C (3V150°C Bit has to be set)	3.0	3.3	3.6	V
VDD_Burn	Positive supply voltage	Supply voltage required for programming in 3.3V operation	3.3		3.5	V

Symbol	Parameter	Conditions	Min	Typ	Max	Units
t_{pon}	Power-on time	Not tested, guaranteed by design. Time between VDD > VDDMIN and the first valid outcome			10	ms

Detailed Description

The AS5147P is a Hall-effect magnetic sensor using a CMOS technology. The Hall sensors convert the magnetic field component perpendicular to the surface of the chip into a voltage.

The signals from the Hall sensors are amplified and filtered by the analog front-end (AFE) before being converted by the analog-to-digital converter (ADC). The output of the ADC is processed by the hardwired CORDIC (coordinate rotation digital computer) block to compute the angle and magnitude of the magnetic vector. The intensity of the magnetic field (magnitude) is used by the automatic gain control (AGC) to adjust the amplification level for compensation of the temperature and magnetic field variations.

The AS5147P generates continuously the angle information, which can be requested by the different interfaces of the device. The internal 14-bit resolution is available by readout register via the SPI interface. The resolution on the ABI output can be programmed for 10, 11 or 12 bits.

The Dynamic Angle Error Compensation block corrects the calculated angle regarding latency, by using a linear prediction calculation algorithm. At constant rotation speed the latency time is internally compensated by the AS5147P, reducing the dynamic angle error at the SPI, ABI and UVW outputs. The AS5147P allows selecting between a UVW output interface and a PWM-encoded interface on the W pin.

At higher speeds, the interpolator fills in missing ABI pulses and generates the UVW signals with no loss of resolution. The non-volatile settings in the AS5147P can be programmed through the SPI interface without any dedicated programmer. The AS5147P can support high speed application up to 28krpm.

Power Management

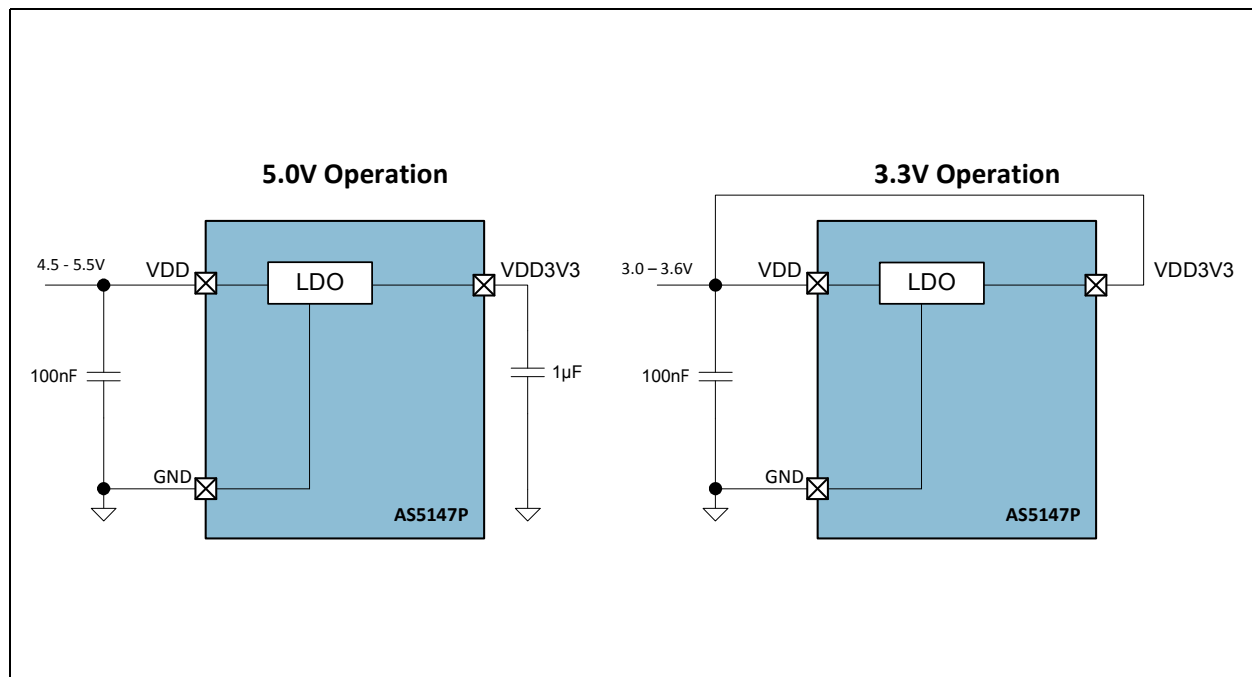

The AS5147P can be either powered from a 5.0V supply using the on-chip low-dropout regulator or from a 3.3V voltage supply. The LDO regulator is not intended to power any other loads, and it needs a 1 μ F capacitor to ground located close to the chip for decoupling as shown in Figure 11.

In 3.3V operation, VDD and VREG must be tied together. In this configuration, normal noise performance (ONL) is available at reduced maximum temperature (125°C) by clearing NOISESET to 0. When NOISESET is set to 1, the full temperature range is available with reduced noise performance (ONH).

Figure 10:
Temperature Range and Output Noise in 3.3V and 5.0V Mode

VDD (V)	NOISESET	Temperature Range (°C)	RMS Output Noise (degree)
5.0	0	-40 to 150	0.068
3.3	0	-40 to 125	0.068
3.3	1	-40 to 150	0.082

Figure 11:
5.0V and 3.3V Power Supply Options

After applying power to the chip, the power-on time (t_{pon}) must elapse before the AS5147P provides the first valid data.

Dynamic Angle Error Compensation

The AS5147P uses 4 integrated Hall sensors which produce a voltage proportional to the orthogonal component of the magnetic field to the die. These voltage signals are amplified, filtered, and converted into the digital domain to allow the CORDIC digital block to calculate the angle of the magnetic vector. The propagation of these signals through the analog front-end and digital back-end generates a fixed delay between the time of measurement and the availability of the measured angle at the outputs. This latency generates a dynamic angle error represented by the product of the angular speed (ω) and the system propagation delay (t_{delay}):

$$(EQ1) \quad DAE = \omega \times t_{\text{delay}}$$

The dynamic angle compensation block calculates the current magnet rotation speed (ω) and multiplies it with the system propagation delay (t_{delay}) to determine the correction angle to reduce this error. At constant speed, the residual system propagation delay is $t_{\text{delay_DAEC}}$.

The angle represented on the **PWM** interface is not compensated by the Dynamic Angle Error Compensation algorithm. It is also possible to disable the Dynamic Angle Error Compensation with the **DAECDIS** setting. Disabling the Dynamic Angle Error Compensation gives a noise benefit of 0.016 degree rms. This setting can be advantageous for low speed (under 100 RPM) respectively static positioning applications.

SPI Interface (Slave)

The SPI interface is used by a host microcontroller (master) to read or write the volatile memory as well as to program the non-volatile OTP registers. The AS5147P SPI only supports slave operation mode. It communicates at clock rates up to 10 MHz.

The AS5147P SPI uses mode=1 (CPOL=0, CPHA=1) to exchange data. As shown in Figure 12, a data transfer starts with the falling edge of CSn (SCL is low). The AS5147P samples MOSI data on the falling edge of SCL. SPI commands are executed at the end of the frame (rising edge of CSn). The bit order is MSB first. Data is protected by parity.

SPI Timing

The AS5147P SPI timing is shown in Figure 12.

Figure 12:
SPI Timing Diagram

Figure 13:
SPI Timing

Parameter	Description	Min	Max	Units
t_L	Time between CSn falling edge and CLK rising edge	350		ns
t_{clk}	Serial clock period	100		ns
t_{clkL}	Low period of serial clock	50		ns
t_{clkH}	High period of serial clock	50		ns
t_H	Time between last falling edge of CLK and rising edge of CSn	$t_{clk}/2$		ns
t_{CSn}	High time of CSn between two transmissions	350		ns
t_{MOSI}	Data input valid to falling clock edge	20		ns
t_{MISO}	CLK edge to data output valid		51	ns
t_{OZ}	Release bus time after CS rising edge.		10	ns

SPI Transaction

An SPI transaction consists of a 16-bit command frame followed by a 16-bit data frame. [Figure 14](#) shows the structure of the command frame.

Figure 14:
SPI Command Frame

Bit	Name	Description
15	PARC	Parity bit (even) calculated on the lower 15 bits of command frame
14	R/W	0: Write 1: Read
13:0	ADDR	Address to read or write

To increase the reliability of communication over the SPI, an even parity bit (**PARC**) must be generated and sent. A wrong setting of the parity bit causes a parity bit error which is shown the PARERR bit in the error flag register.

The parity bit is calculated from the lower 15 bits of the command frame. The 16-bit command consists of a register address and read/write bit which indicates if the transaction is a read or write and the parity bit. [Figure 15](#) shows the read data frame.

Figure 15:
SPI Read Data Frame

Bit	Name	Description
15	PARD	Parity bit (even) calculated on the lower 15 bits of the read data frame
14	EF	0: No command frame error command occurred 1: Error occurred
13:0	DATA	Data

The data is sent on the MISO pin. The parity bit **PARD** is calculated by the AS5047D of the lower 15 bits of data frame. If an error is detected in the previous SPI command frame, the EF bit is set high. The SPI read is sampled on the rising edge of CSn and the data is transmitted on MISO with the next read command, as shown in [Figure 16](#).

Figure 16:
SPI Read

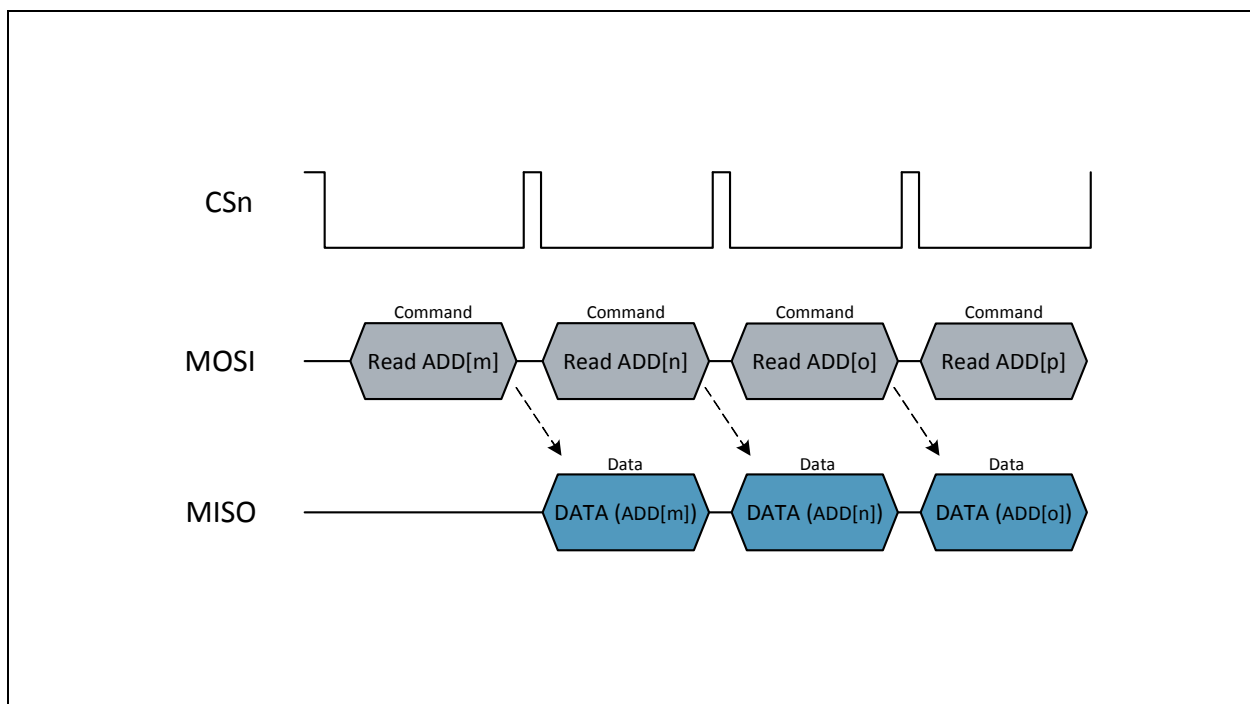

Figure 17:
SPI Write Data Frame

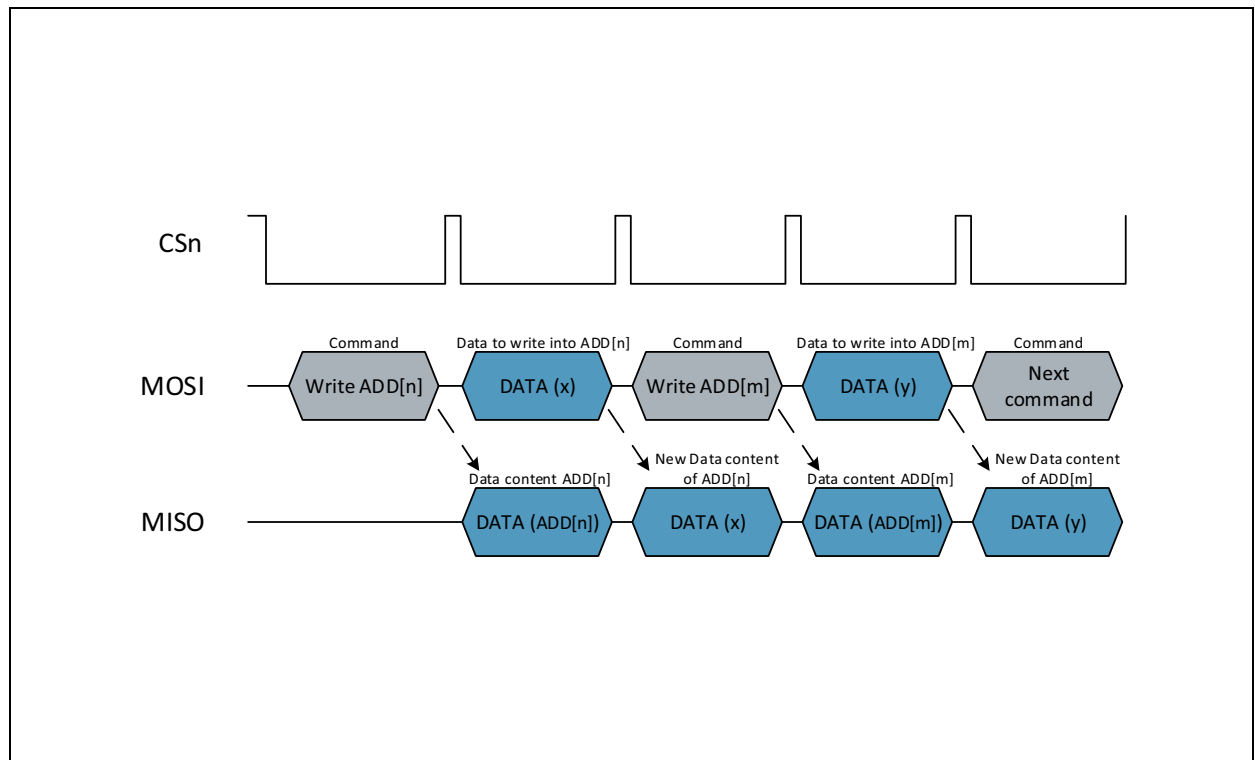

Bit	Name	Description
15	PARD	Parity bit (even)
14	0	Always low
13:0	DATA	Data

The parity bit **PARD** must be calculated from the lower 15 bit of write data frame.

In an SPI write transaction, the write command frame is followed by a write data frame at MOSI. The write data frame consists of the new content of register which address is in the command frame.

During the new content is transmitted on MOSI by the write data frame, the old content is send on MISO. At the next command on MOSI the actual content of the register is transmitted on MISO, as shown in [Figure 18](#).

Figure 18:
SPI Write Transaction

Volatile Registers

The volatile registers are shown in [Figure 19](#). Each register has a 14-bit address.

Figure 19:
Volatile Register Table

Address	Name	Default	Description
0x0000	NOP	0x0000	No operation
0x0001	ERRFL	0x0000	Error register
0x0003	PROG	0x0000	Programming register
0x3FFC	DIAAGC	0x0180	Diagnostic and AGC
0x3FFD	MAG	0x0000	CORDIC magnitude
0x3FFE	ANGLEUNC	0x0000	Measured angle without dynamic angle error compensation
0x3FFF	ANGLECOM	0x0000	Measured angle with dynamic angle error compensation

Reading the NOP register is equivalent to a nop (no operation) instruction for the AS5147P.

Figure 20:
ERRFL (0x0001)

Name	Read/Write	Bit Position	Description
PARERR	R	2	Parity error
INVCOMM	R	1	Invalid command error: set to 1 by reading or writing an invalid register address
FRERR	R	0	Framing error: is set to 1 when a non-compliant SPI frame is detected

Reading the ERRFL register automatically clears its contents (ERRFL=0x0000).

Figure 21:
PROG (0x0003)

Name	Read/Write	Bit Position	Description
PROGVER	R/W	6	Program verify: must be set to 1 for verifying the correctness of the OTP programming
PROGOTP	R/W	3	Start OTP programming cycle
OTPREF	R/W	2	Refreshes the non-volatile memory content with the OTP programmed content
PROGEN	R/W	0	Program OTP enable: enables reading / writing the OTP memory

The PROG register is used for programming the OTP memory.
(See programming the zero position.)

Figure 22:

Non-Volatile Registers (OTP)

The OTP (One-Time Programmable) memory is used to store the absolute zero position of the sensor and the customer settings permanently in the sensor IC.

SPI write/read access is possible several times for all non-volatile registers (soft write). Soft written register content will be lost after a hardware reset. The programming itself can be done just once. Therefore the content of the non-volatile registers is stored permanently in the sensor. The register content is still present after a hardware reset and cannot be overwritten. For a correct function of the sensor the OTP programming is not required. If no configuration or programming is done, the non-volatile registers are in the default state 0x0000.

Figure 26:
Non-Volatile Register Table

Address	Name	Default	Description
0x0016	ZPOSM	0x0000	Zero position MSB
0x0017	ZPOSL	0x0000	Zero position LSB/ MAG diagnostic
0x0018	SETTINGS1	0x0001	Custom setting register 1
0x0019	SETTINGS2	0x0000	Custom setting register 2
0x001A	RED	0x0000	Redundancy register

Figure 27:

Name	Read/Write/Program	Bit Position	Description
REDUNDANCY	R/W/P	4:0	Redundancy bits. This field enables with force to high one bit of the Non-Volatile register map after a non-successful burning. For more details please refer to the application note "AN5000 – AS5147P_Redundancy_Bits"

ABI Incremental Interface

The AS5147P can send the angle position to the host microcontroller through an incremental interface. This interface is available simultaneously with the other interfaces. By default, the incremental interface is set to work at the highest resolution (12 bits), which corresponds to 4096 steps per revolution or 1024 pulses per revolution (ppr). This resolution can be changed with the OTP bits **ABIRES**.

The phase shift between the A and B signals indicates the rotation direction: clockwise (A leads, B follows) or counterclockwise (B leads, A follows). During the start-up time, after power on to the chip, all three ABI signals are high. The **DIR** bit can be used to invert the sense of the rotation direction.

The **IWIDTH** setting programs the width of the index pulse from 3 LSB (default) to 1 LSB.

Figure 32:
ABI Signals at 11-Bit Resolution

N = 4096 for 12-Bit resolution, and N = 1024 for 10-bit resolution.

The **Figure 32** shows the ABI signal flow if the magnet rotates in clockwise direction and counter-clockwise direction (**DIR=0**).

The rotation direction of the magnet is defined as clockwise (**DIR=0**) when the view is from the topside of AS5147P.

UVW Commutation Interface

The AS5147P can emulate the UVW signals generated by the three discrete Hall switches commonly used in BLDC motors. The `UVWPP` field in the `SETTINGS` register selects the number of pole pairs of the motor (from 1 to 7 pole pairs). The UVW signals are generated with 14-bit resolution.

During the start-up time, after power on of the chip, the UVW signals are low.

Figure 33:
UVW Signals

The [Figure 33](#) shows the UVW signal flow if the magnet rotates in clockwise direction and counter-clockwise direction (`DIR=0`). The rotation direction of the magnet is defined as clockwise (`DIR=0`) when the view is from the topside of AS5047D. With the bit `DIR`, it is possible to invert the rotation direction.

PWM

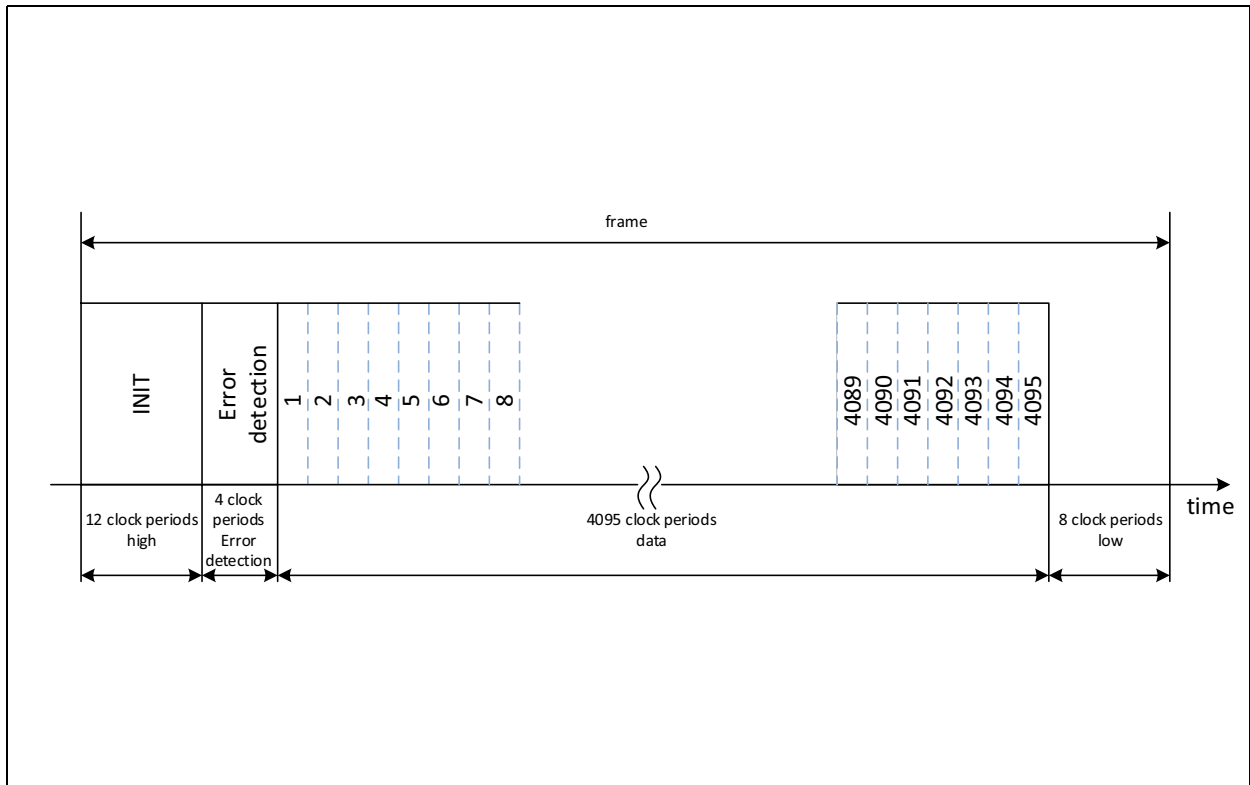

The PWM can be enabled with the bit setting PWMon. The PWM encoded signal is displayed on the pin W or the pin I. The bit setting UVW_ABI defines which output is used as PWM. The PWM output consists of a frame of 4119 PWM clock periods, as shown in Figure 34. The PWM frame has the following sections:

- 12 PWM Clocks for INIT
- 4 PWM Clocks for Error detection
- 4095 PWM clock periods of data
- 8 PWM clock periods low

The angle is represented in the data part of the frame with a 12-bit resolution. One PWM clock period represents 0.088 degree and has a typical duration of 444 ns.

If the embedded diagnostic of the AS5147P detects any error the PWM interface displays only 12 clock periods high (0.3% duty-cycle). Respectively the 4 clocks for error detection are forced to low.

Figure 34:
Pulse Width Modulation Encoded Signal

Hysteresis

The hysteresis can be programmed in the **HYS** bits of the **SETTINGS2** register. The hysteresis can be 1, 2, or 3 LSB bits, in which the LSB is defined by the ABI resolution setting (**ABIRES**).

Figure 35:
Hysteresis Settings

HYS	Hysteresis Related to 11 Bit ABI Resolution
00	3
01	2
10	1
11	0

Automatic Gain Control (AGC) and CORDIC Magnitude

The AS5147P uses AGC to compensate for variations in the magnetic field strength due to changes of temperature, air gap between the chip and the magnet, and demagnetization of the magnet. The automatic gain control value can be read in the AGC field of the DIAAGC register. Within the specified input magnetic field strength (**Bz**), the Automatic Gain Control keeps the CORDIC magnitude value (**MAG**) constant. Below the minimum input magnetic field strength, the CORDIC magnitude decreases and the **MAGL** bit is set.

Diagnostic Features

The AS5147P supports embedded self-diagnostics.

MAGH: magnetic field strength too high, set if AGC = 0x00. This indicates the non-linearity error may be increased.

MAGL: magnetic field strength too low, set high if AGC = 0xFF. This indicates the output noise of the measured angle may be increased.

COF: CORDIC overflow. This indicates the measured angle is not reliable.

LF: offset compensation completed. At power-up, an internal offset compensation procedure is started, and this bit is set when the procedure is completed.
