

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# AS5162

## 12-Bit Magnetic Angle Position Sensor

### General Description

The AS5162 is a contactless magnetic angle position sensor for accurate angular measurement over a full turn of 360°. A sub range can be programmed to achieve the best resolution for the application. It is a system-on-chip, combining integrated Hall elements, analog front end, digital signal processing and best in class automotive protection features in a single device.

To measure the angle, only a simple two-pole magnet, rotating over the center of the chip, is required. The magnet may be placed above or below the IC.

The absolute angle measurement provides instant indication of the magnet's angular position with a resolution of  $0.022^\circ = 16384$  positions per revolution. According to this resolution the adjustment of the application specific mechanical positions are possible. The angular output data is available over a 12 bit ratiometric analog output.

The AS5162 operates at a supply voltage of 5V and the supply and output pins are protected against overvoltage up to +20V. In addition the supply pins are protected against reverse polarity up to -20V.

**Figure 1:**  
Typical Arrangement of AS5162 and Magnet

*Ordering Information and Content Guide appear at end of datasheet.*

## Key Benefits & Features

The benefits and features of AS5162, 12-Bit Magnetic Angle Position Sensor are listed below:

**Figure 2:**  
**Added Value of Using AS5162**

Benefits	Features
<ul style="list-style-type: none"> <li>Great flexibility on angular excursion</li> </ul>	<ul style="list-style-type: none"> <li>360° contactless high resolution angular position sensing</li> </ul>
<ul style="list-style-type: none"> <li>Simple programming</li> </ul>	<ul style="list-style-type: none"> <li>User programmable start and end point of the application region</li> <li>Saw tooth mode 1-4 slopes per revolution</li> <li>Clamping levels</li> <li>Transition point</li> </ul>
<ul style="list-style-type: none"> <li>Failure diagnostics</li> </ul>	<ul style="list-style-type: none"> <li>Broken GND and VDD detection for all external load cases</li> </ul>
<ul style="list-style-type: none"> <li>High-Resolution output signal</li> </ul>	<ul style="list-style-type: none"> <li>Analog output ratiometric to VDD</li> </ul>
<ul style="list-style-type: none"> <li>Ideal for applications in harsh environments due to contactless position sensing</li> </ul>	<ul style="list-style-type: none"> <li>Wide temperature range: - 40°C to 150°C</li> </ul>

## Applications

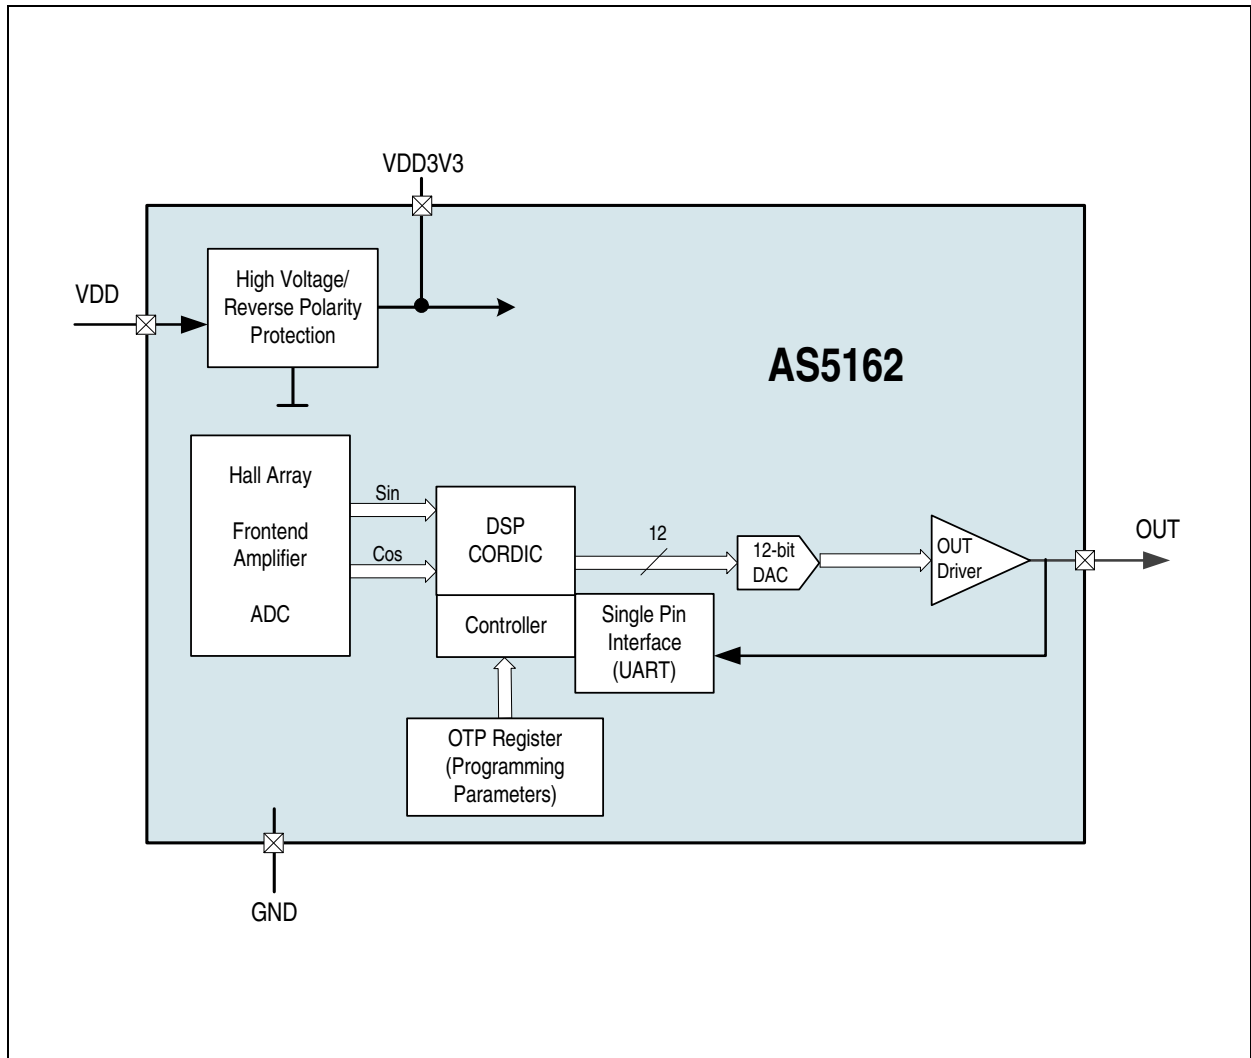

The AS5162 is ideal for automotive applications like:

- Throttle and valve position sensing
- Gearbox position sensor
- Tumble flap
- Chassis height level
- Pedal position sensing
- Contactless potentiometers

### Block Diagram

The functional blocks of this device are shown below:

**Figure 3:**  
**AS5162 Block Diagram**

## Pin Assignment

Figure 4:  
SOIC-8 Pin Configuration

Figure 5:  
SOIC-8 Pin Description

Pin Number	Pin Name	Pin Type	Description
1	VDD	Supply pin	<b>Positive supply pin.</b> This pin is over voltage protected.
2	TP1	DIO/AIO multi purpose pin	<b>Test pin for fabrication.</b> Connected to ground in the application board.
3	VDD3V3	AIO	Output of the internal voltage regulator
4	GND	Supply pin	<b>Ground pin.</b> Connected to ground in the application.
5	TP2	DIO/AIO multi purpose pin	<b>Test pin for fabrication.</b> Connected to ground in the application board.
6	TP3	DIO/AIO multi purpose pin	<b>Test pin for fabrication.</b> Open in the application.
7	S	AIO	<b>Test pin for fabrication.</b> Connected to OUT in the application board.
8	OUT	DIO/AIO multi purpose pin	<b>Output pin analog output.</b> Over this pin the programming is possible.

## Absolute Maximum Ratings

Stresses beyond those listed in [Absolute Maximum Ratings](#) may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in [Electrical Characteristics](#) is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Figure 6:**  
Absolute Maximum Ratings

Symbol	Parameter	Min	Max	Units	Comments
<b>Electrical Parameters</b>					
$V_{DD}$	DC supply voltage at pin VDD Overvoltage	-20	20	V	No operation
$V_{OUT}$	Output voltage OUT	-0.3	20	V	Permanent
$V_{diff}$	Voltage difference at pin VDD and OUT	-20	20	V	
$V_{DD3V3}$	DC supply voltage at pin $V_{DD3V3}$	-0.3	5	V	
$I_{scr}$	Input current (latchup immunity)	-100	100	mA	Norm: AEC-Q100-004
<b>Electrostatic Discharge</b>					
ESD	Electrostatic discharge	$\pm 2$		kV	Norm: AEC-Q100-002
<b>Temperature Ranges and Storage Conditions</b>					
$T_{strg}$	Storage temperature	-55	150	°C	Min -67°F; Max 302°F
$T_{Body}$	Body temperature		260	°C	The reflow peak soldering temperature (body temperature) specified is in accordance with IPC/JEDEC J-STD-020 "Moisture/Reflow Sensitivity Classification for Non-Hermetic Solid State Surface Mount Devices". The lead finish for Pb-free leaded packages is matte tin (100% Sn).
$RH_{NC}$	Relative humidity (non-condensing)	5	85	%	
MSL	Moisture Sensitivity Level	3			Represents a maximum floor life time of 168h

## Electrical Characteristics

### Operating Conditions

In this specification, all the defined tolerances for external components need to be assured over the whole operation conditions range and also over lifetime.

Figure 7:  
Operating Conditions

Symbol	Parameter	Conditions	Min	Typ	Max	Units
$T_{AMB}$	Ambient temperature		-40		150	°C
$I_{SUPP}$	Supply current				12	mA
$V_{DD}$	Supply voltage at pin VDD		4.5	5.0	5.5	V

### Magnetic Input Specification

$T_{AMB} = -40^{\circ}\text{C}$  to  $150^{\circ}\text{C}$ ,  $V_{DD} = 4.5\text{V}$  to  $5.5\text{V}$  (5V operation), unless otherwise noted.

## Detailed Description

The AS5162 is manufactured in a CMOS process and uses a spinning current Hall technology for sensing the magnetic field distribution across the surface of the chip.

The integrated Hall elements are placed around the center of the device and deliver a voltage representation of the magnetic field at the surface of the IC.

Through Sigma-Delta Analog / Digital Conversion and Digital Signal-Processing (DSP) algorithms, the AS5162 provides accurate high-resolution absolute angular position information. For this purpose a Coordinate Rotation Digital Computer (CORDIC) calculates the angle and the magnitude of the Hall array signals.

The DSP is also used to provide digital information at the outputs that indicate movements of the used magnet towards or away from the device's surface.

A small low cost diametrically magnetized (two-pole) standard magnet provides the angular position information.

The AS5162 senses the orientation of the magnetic field and calculates a 14-bit binary code. This code is mapped to a programmable output characteristic in analog voltage format. This signal is available at the pin (**OUT**).

The application angular region can be programmed in a user friendly way. The start angle position **T1** and the end point **T2** can be set and programmed according the mechanical range of the application with a resolution of 14 bits. In addition the **T1Y** and **T2Y** parameter can be set and programmed according the application. The transition point 0 to 360 degree can be shifted using the break point parameter **BP**. The voltage for clamping level low **CLL** and clamping level high **CLH** can be programmed with a resolution of 9 bits. Both levels are individually adjustable.

The output parameters can be programmed in an OTP register. No additional voltage is required to program the AS5162. The setting may be overwritten at any time and will be reset to default when power is cycled. To make the setting permanent, the OTP register must be programmed by using a lock bit the content could be frozen for ever.

The AS5162 is tolerant to magnet misalignment and unwanted external magnetic fields due to differential measurement technique and Hall sensor conditioning circuitry.

## Operation

### **VDD Voltage Monitor**

**VDD Over Voltage Management.** If the supply voltage at pin **VDD** exceeds the over-voltage upper threshold for longer than the detection time the output is turned off. When the over-voltage event has passed and the voltage applied to pin **VDD** falls below the over-voltage lower threshold for longer than the recovery time the device enters the normal mode and the output is enabled.

**VDD Under Voltage Management.** When the voltage applied to the **VDD** pin falls below the under-voltage lower threshold for longer than the detection time the output is turned off. When the voltage applied to the **VDD** pin exceeds the under-voltage upper threshold for longer than the detection time the device enters the normal mode and the output is enabled.

### **Analog Output**

By default (after programmed **CUST\_LOCK** OTP bit) the analog output mode is selected. The pin **OUT** provides an analog voltage that is proportional to the angle of the rotating magnet and ratiometric to the supply voltage **VDD**. It can source or sink currents up in normal operation. A short circuit protection is in place and will switch the output driver in high Z in case of an overload event. Due to an intelligent approach a permanent short circuit will not damage the device. This is also feasible in a high voltage condition up to 20 V and at the highest specified ambient temperature.

After the digital signal processing (DSP) a 12-bit Digital-to-Analog converter and output stage provides the output signal.

The DSP maps the application range to the output characteristic. An inversion of the slope is also programmable to allow inversion of the rotation direction.

The reference voltage for the Digital-to-Analog converter (DAC) is taken from **VDD**. In this mode, the output voltage is ratiometric to the supply voltage.

An on-chip diagnostic feature handles the error state at the output. Depending on the failure the output is in HiZ condition or is driven in the failure band (see [Figure 21](#)).

### **Programming Parameters**

The analog output characteristic is programmable by OTP. Depending on the application, the analog output can be adjusted. The user can program the following application specific parameters.

**Figure 13:**  
**Programming Parameters**

Parameter	Description
T1	Mechanical angle start point
T2	Mechanical angle end point
T1Y	Voltage level at the T1 position
T2Y	Voltage level at the T2 position
CLL	Clamping Level Low
CLH	Clamping Level High
BP	Break point (transition point 0 to 360°)

These parameters are input parameters. Using the available programming software and programmer these parameters are converted and finally written into the AS5162 128 bit OTP memory.

**Application Specific Angular Range Programming**

The application range can be selected by programming **T1** with a related **T1Y** and **T2** with a related **T2Y** into the AS5162. The clamping levels **CLL** and **CLH** can be programmed independent from the **T1** and **T2** position and both levels can be separately adjusted.

**Figure 14:**  
Programming of an Individual Application Range

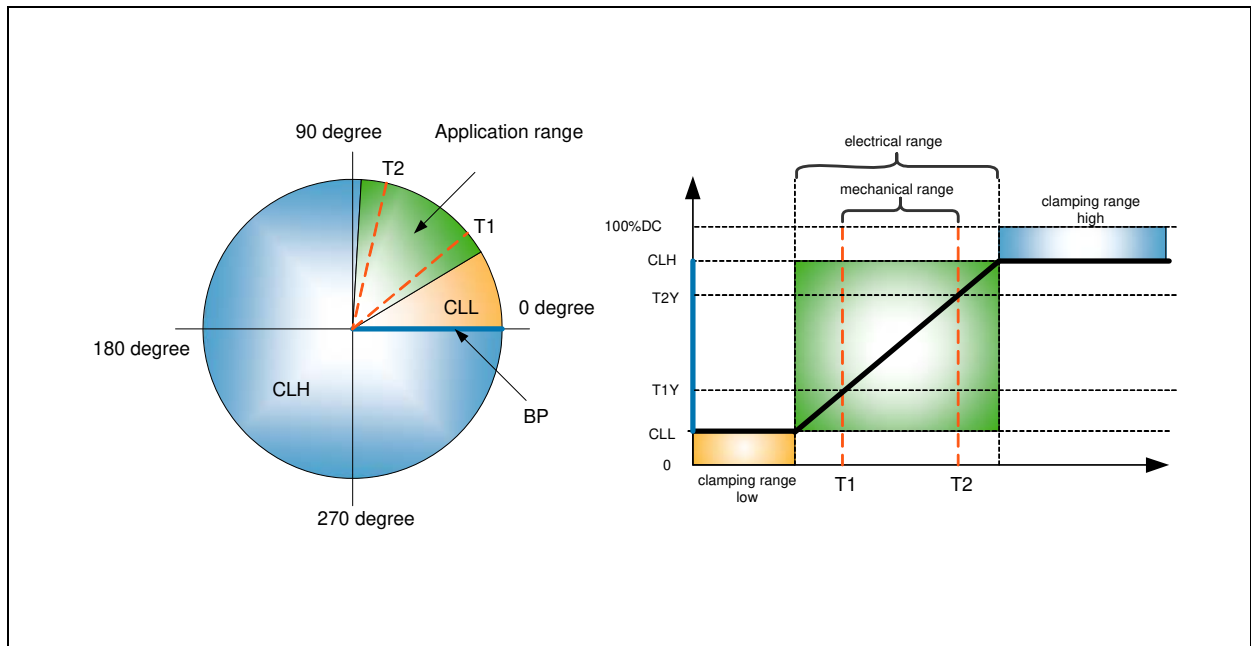

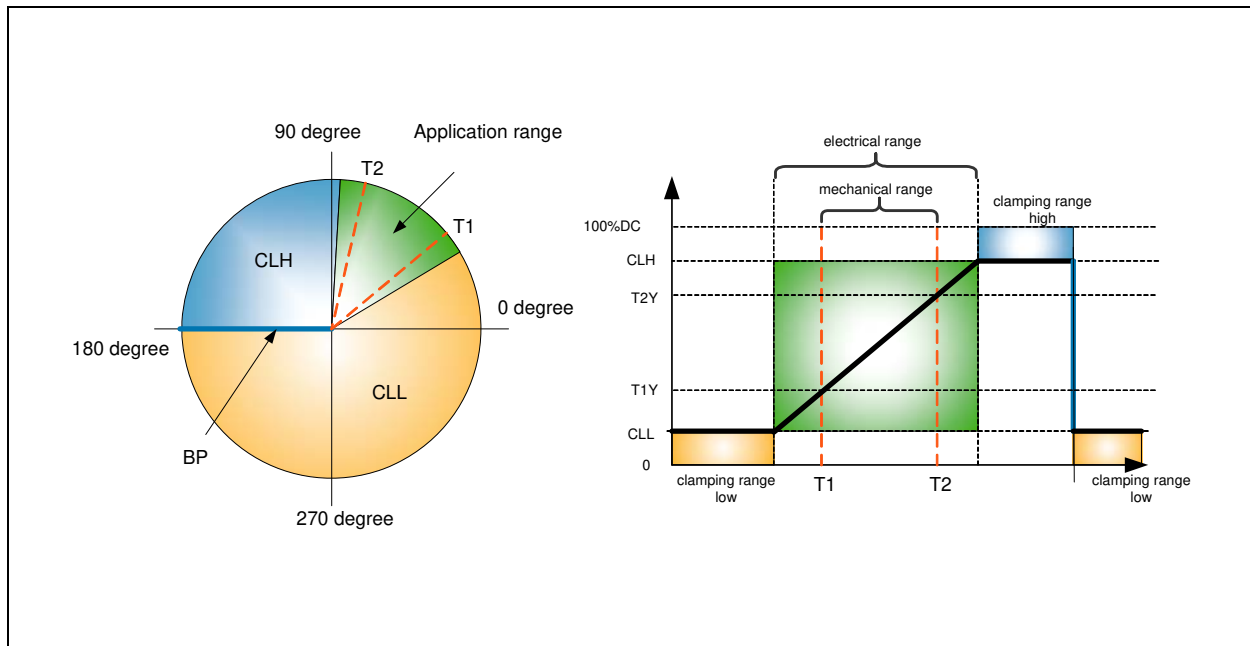

Figure 14 shows a simple example of the selection of the range. The mechanical starting point **T1** and the mechanical end point **T2** are defining the mechanical range. A sub range of the internal CORDIC output range is used and mapped to the needed output characteristic. The analog output signal has 12 bit, hence the level **T1Y** and **T2Y** can be adjusted with this resolution. As a result of this level and the calculated slope the clamping region low is defined. The break point **BP** defines the transition between **CLL** and **CLH**. In this example the **BP** is set to 0 degree. The **BP** is also the end point of the clamping level high **CLH**. This range is defined by the level **CLH** and the calculated slope. Both clamping levels can be set independently form each other.

**Application Specific Programming of the Break Point**

The break point **BP** can be programmed as well with 14 bits. This is important when the default transition point is inside the application range. In such a case the default transition point must be shifted out of the application range. The parameter **BP** defines the new position.

**Figure 15:**  
Individual Programming of the Break Point BP

**Full Scale Mode**

**Figure 16:**  
Full Scale Mode

For simplification, [Figure 16](#) describes a linear output voltage from rail to rail (0V to VDD) over the complete rotation range. In practice, this is not feasible due to saturation effects of the output stage transistors. The actual curve will be rounded towards the supply rails (as indicated [Figure 16](#)).

**Multiple Slope Output**

The AS5162 can be programmed to multiple slopes. Where one programmed reference slope characteristic is copied to multiple slopes. Two, three and four slopes are selectable by the user OTP bits QUADEN (1:0). In addition to the steepness of the slope the clamping levels can be programmed as well.

**Figure 17:**  
**Two Slope Mode**

**Figure 18:**  
**Four Slope Mode**

**Resolution of Parameters**

The programming parameters have a wide resolution of up to 14 bits.

**Figure 19:**  
Resolution of the Programming Parameters

Symbol	Parameter	Resolution	Note
T1	Mechanical angle start point	14 bits	
T2	Mechanical angle stop point	14 bits	
T1Y	Mechanical start voltage level	12 bits	
T2Y	Mechanical stop voltage level	12 bits	
CLL	Clamping level low	9 bits	
CLH	Clamping level high	9 bits	
BP	Break point	14 bits	

**Figure 20:**  
Overview of the Angular Output Voltage

Figure 20 gives an overview of the different ranges. The failure bands are used to indicate a wrong operation of the AS5162. This can be caused due to a broken supply line. By using the specified load resistors, the output level will remain in these bands during a fail. It is recommended to set the clamping level **CLL** above the lower failure band and the clamping level **CLH** below the higher failure band.

**Analog Output Diagnostic Mode**

Due to the low pin count in the application a wrong operation must be indicated by the output pin **OUT**. This could be realized using the failure bands. The failure band is defined with a fixed level. The failure band low is specified from 0 to 4% of the supply range over the total operation range. The failure band high is defined always from 96 to 100%. Several failures can happen during operation. The output signal remains in these bands over the specified operating and load conditions. All different failures can be grouped into the internal alarms (failures) and the application related failures.

$$C_{LOAD} \leq 33 \text{ nF}, R_{PU} = 4\text{k}\Omega \text{ to } 10\text{k}\Omega$$

$$R_{PD} = 4\text{k}\Omega \text{ to } 10\text{k}\Omega \text{ load pull-up}$$

**Figure 21:**  
Different Failure Cases of AS5162

Type	Failure Mode	Symbol	Failure Band	Note
Internal alarms (failures)	Out of magnetic range (too less or too high magnetic input)	MAGRng	High/Low	Programmable by OTP bit <b>DIAG_HIGH</b>
	CORDIC overflow	COF	High/Low	Programmable by OTP bit <b>DIAG_HIGH</b>
	Offset compensation finished	OCF	High/Low	Programmable by OTP bit <b>DIAG_HIGH</b>
	Watchdog fail	WDF	High/Low	Programmable by OTP bit <b>DIAG_HIGH</b>
	Oscillator fail	OF	High/Low	Programmable by OTP bit <b>DIAG_HIGH</b>
Application related failures	Overvoltage condition	OV	High/Low	Dependant on the load resistor Pull up → failure band high Pull down → failure band low
	Broken VDD	BVDD		
	Broken VSS	BVSS		
	Short circuit output	SCO	High/Low	Switch off → short circuit dependent

For efficient use of diagnostics, it is recommended to program to clamping levels **CLL** and **CLH**.

### Analog Output Driver Parameters

The output stage is configured in a push-pull output. Therefore it is possible to sink and source currents.

$$C_{LOAD} \leq 33\text{nF}, R_{PU} = 4\text{k}\Omega \text{ to } 10\text{k}\Omega;$$

$$R_{PD} = 4\text{k}\Omega \text{ to } 10\text{k}\Omega \text{ load pull-up}$$

**Figure 22:**  
General Parameters for the Output Driver

Symbol	Parameter	Min	Typ	Max	Unit	Note
IOUTSCL	Short circuit output current (low side driver)	5	10	20	mA	$V_{OUT}=20V$
IOUTSCH	Short circuit output current (high side driver)	-20	-10	-5	mA	$V_{OUT}=0V$
TSCDET	Short circuit detection time	20		600	$\mu\text{s}$	output stage turned off
TSCREC	Short circuit recovery time	2		20	ms	output stage turned on
ILEAKOUT	Output Leakage current	-20		20	$\mu\text{A}$	$V_{OUT}=V_{DD}=5V$
BGNDDPU	Output voltage broken GND with pull-up	96		100	%VDD	
BGNDDPD	Output voltage broken GND with pull-down	0		4	%VDD	
BVDDPU	Output voltage broken VDD with pull-up	96		100	%VDD	
BVDDPD	Output voltage broken VDD with pull-down	0		4	%VDD	
OUTRATIO	Output ratiometric error	-0.5		0.5	%VDD	
OUTDNL	Output DNL			$10^{(1)}$	LSB	Between 4% and 96% of VDD
OUTINL	Output INL	$-10^{(2)}$		$10^{(2)}$	LSB	Between 4% and 96% of VDD

**Note(s) and/or Footnote(s):**

1. This parameter will be finally defined after temperature characterisation.
2. Design target for this value is reduced.

### Hysteresis Function

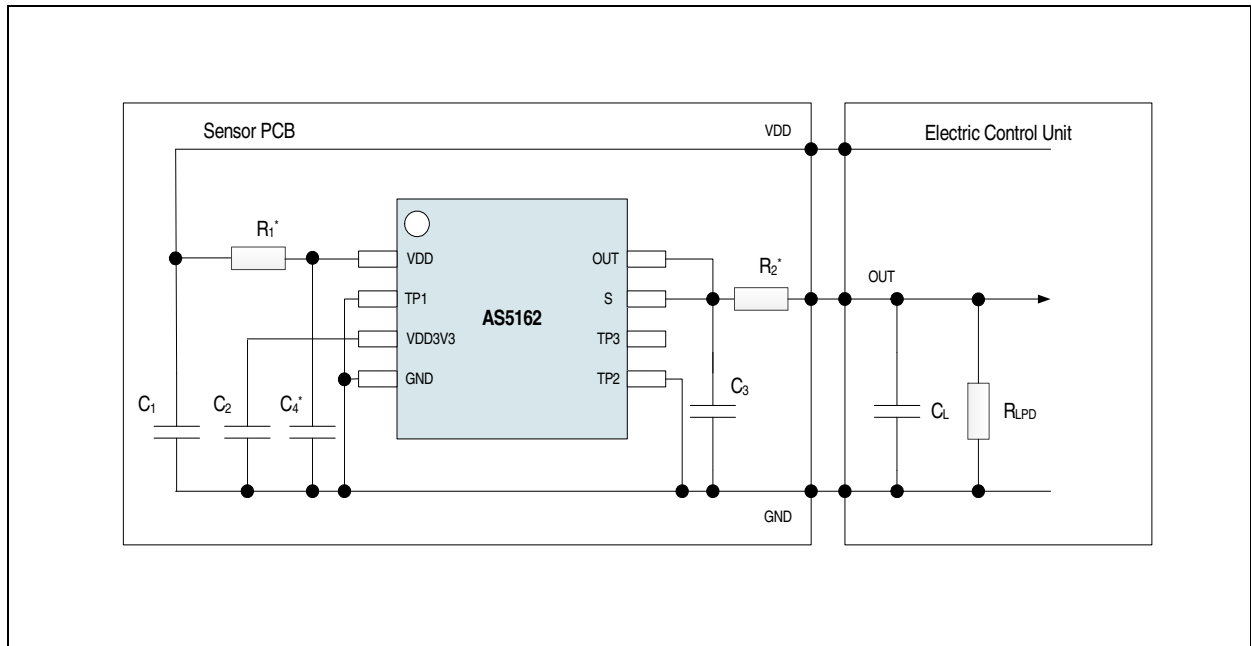

AS5162 device includes a hysteresis function to avoid sudden jumps from CLH to CLL and vice versa caused by noise in the full turn configuration. The hysteresis amplitude can be selected via the OTP bits **HYSTSEL<1:0>**.

## Application Information

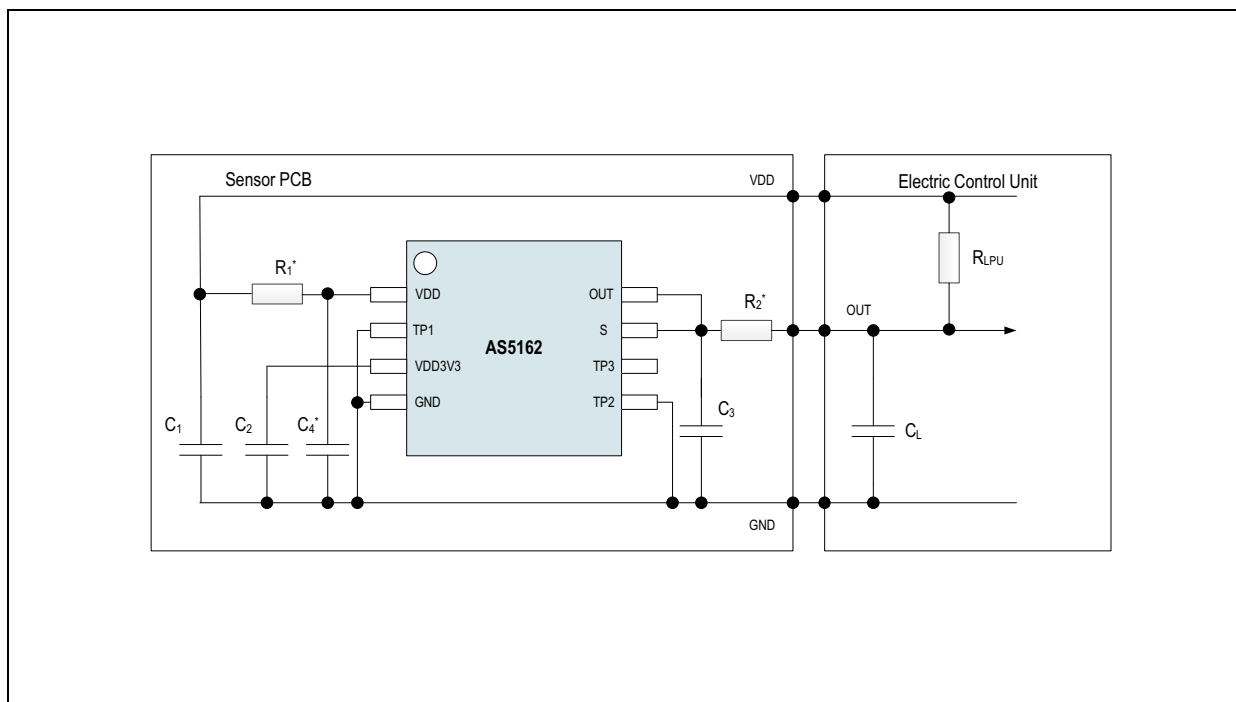

### Recommended Application Schematic

Figure 23 and Figure 24 show the recommended schematic in the application. All components marked with (\*) are optional and can be used to further increase the EMC.

**Figure 23:**  
Recommended Schematic of Pull-Down Configuration

$C_L$	OUT load capacitor (ECU)	0		33	nF	
$R_2^*$	OUT serial resistor (optional)		50		$\Omega$	
$R_{LPU}$	OUT pull-up resistance	4		10	k $\Omega$	
$R_{LPD}$	OUT pull-down resistance	4		10	k $\Omega$	

## Programming the AS5162

The AS5162 programming is a one-time-programming (OTP) method, based on polysilicon fuses. The advantage of this method is that no additional programming voltage is needed. The internal LDO provides the current for programming.

The OTP consists of 128 bits; several bits are available for user programming. In addition factory settings are stored in the OTP memory. Both regions are independently lockable by build in lock bits.

A single OTP cell can be programmed only once. Per default, the cell is "0"; a programmed cell will contain a "1". While it is not possible to reset a programmed bit from "1" to "0", multiple OTP writes are possible, as long as only unprogrammed "0"-bits are programmed to "1".

Independent of the OTP programming, it is possible to overwrite the OTP register temporarily with an OTP write command. This is possible only if the user lock bit is not programmed.

Due to the programming over the output pin the device will initially start in the communication mode. In this mode the digital angle value can be read with a specific protocol format. It is a bidirectional communication possible. Parameters can be written into the device. A programming of the device is triggered by a specific command. With another command (pass2func) the device can be switched into operation mode. In case of a programmed user lock bit the AS5162 automatically starts up in the functional operation mode. No communication of the specific protocol is possible after this.

A standard half duplex UART protocol is used to exchange data with the device in the communication mode.

### **UART Interface for Programming**

The AS5162 uses a standard UART interface with an address byte and two data bytes. The read or write mode is selected with bit R/Wn in the first byte. The timing (baudrate) is selected by the AS5162 over a synchronization frame. The baud rate register can be read and overwritten (optional). Every start bit is used for synchronization.

A time out function detects not complete commands and resets the AS5162 UART after the timeout period.

### Frame Organization

Each frame is composed by 24 bits. The first byte of the frame specifies the read/write operation with the register address. 16 data bits contains the communication data. There will be no operation in case of the usage of a not specified CMD. The UART programming interface block of the AS5162 can operate in slave communication or master communication mode. In the slave communication mode the AS5162 receives the data. The programming tool is the driver of the single communication line. In case of the master communication mode the AS5162 transmits data in the frame format. The single communication line can be pulled down by the AS5162.

The UART frame consists of 1 start bit (low level), 8 data bit, 1 even-parity bit and 1 stop bit (high level). Data are transferred from LSB to MSB.

**Figure 26:**  
General UART Frame

**Figure 27:**  
Bit Timing

Symbol	Parameter	Min	Typ	Max	Unit	Note
START	Start bit		1		TBIT	
Dx	Data bit		1		TBIT	
PAR	Parity bit		1		TBIT	
STOP	Stop bit	1			TBIT	
TSW	Slave/Master Switch Time		7		TBIT	

Each communication starts with the reception of a request from the external controller. The request consists of two frames: one synchronization frame and the command frame.

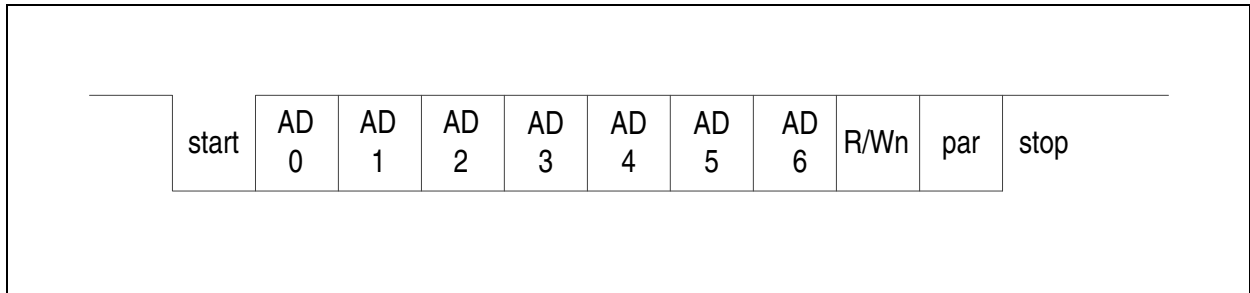

The synchronization frame contains the data 0x55 and allows the UART to measure the external controller baud rate.

**Figure 28:**  
Synchronization Frame

The second frame contains the command Read/ Write (1 bit) and the address (7 bits).

**Figure 29:**  
Address and Command Frame

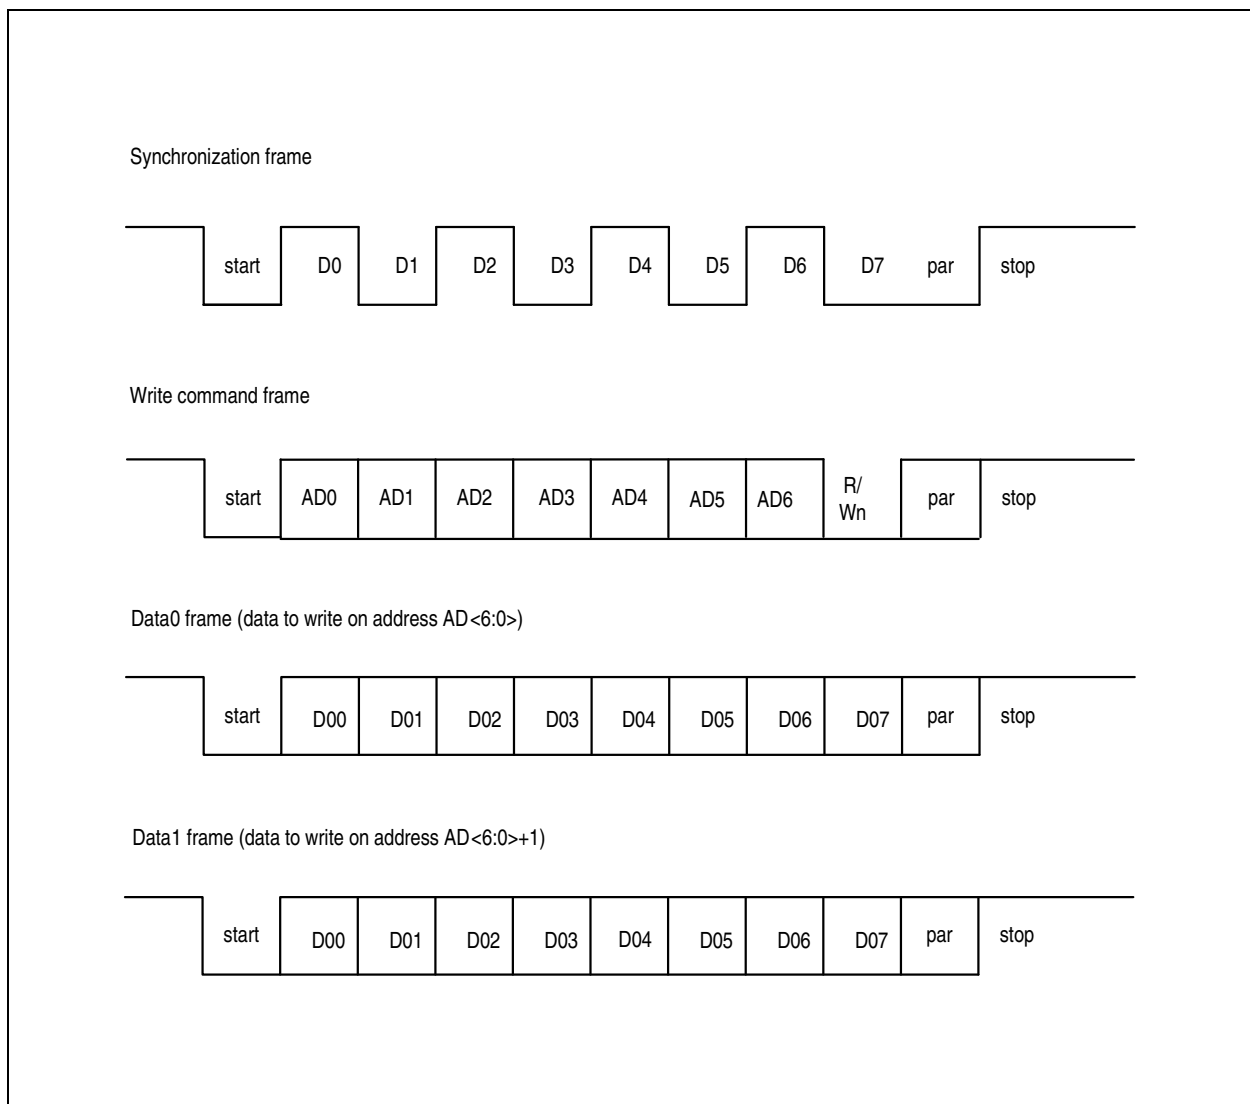

Only two commands are possible. In case of read command the idle phase between the command and the answer is the time TSW. In case of parity error command is not executed.

**Figure 30:**  
Possible Commands

Possible Interface Commands	Description	AS5X63 Communication Mode	Command CMD
WRITE	Write data to the OTP memory or Registers	SLAVE	0
READ	Read data to the OTP memory or Registers	SLAVE & MASTER	1

**Note(s) and/or Footnote(s):**

1. In case of Write command the request is followed by the frames containing the data to write.
2. In case of Read command the communication direction will change and the AS5162 will answer with the frames containing the requested data.

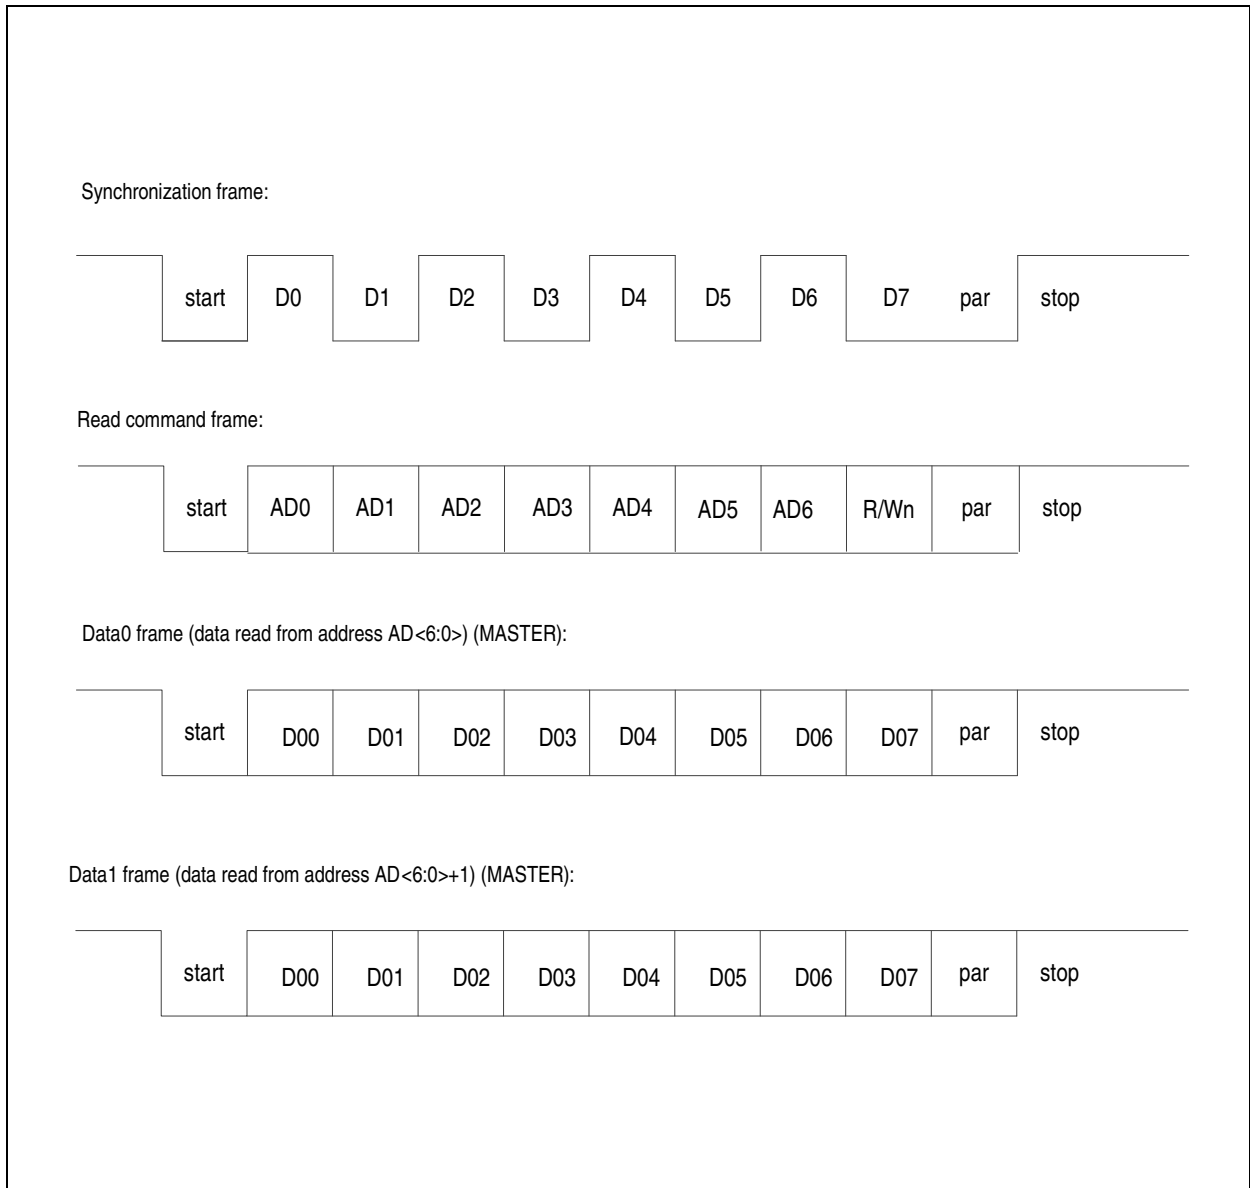

**WRITE (Command Description)****Figure 31:  
Full Write Command**

- Writing the AS5162 KEY in the fuse register (address 0x41) triggers the transfer of the data from the OTP RAM into the Poly Fuse cell.
- Writing the AS5162 KEY in the Pass2Func Register (address 0x60) forces the device into normal mode.

**READ (Command Description)**

**Figure 32:  
Full Read Command**

**Baud-Rate Automatic Detection**

The UART includes a built-in baud-rate monitor that uses the synchronization frame to detect the external controller baud-rate. This baud-rate is used after the synchronization byte to decode the following frame and to transmit the answer and it is stored in the BAUDREG register.

### Baud-Rate Manual Setting (Optional)

The BAUDREG register can be read and over-written for a possible manual setting of the baud-rate: in case the register is overwritten with a value different from 0, this value will be used for the following UART communications and the synchronization frame must be removed from the request.

**Figure 33:**  
Manual Baud-Rate Setting

**Figure 34:**  
Simple Read and Write
