

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# AT-41532

General Purpose, Low Current NPN Silicon Bipolar Transistor

## Data Sheet

### Description

Avago's AT-41532 is a general purpose NPN bipolar transistor that has been optimized for maximum ft at low voltage operation, making it ideal for use in battery powered applications in cellular/PCS and other wireless markets. The AT-41532 uses the miniature 3-lead SOT-323 (SC-70) plastic package.

Optimized performance at 5 V makes this device ideal for use in 900 MHz, 1.8 GHz, and 2.4 GHz systems. Typical amplifier design at 900 MHz yields 1 dB NF and 15.5 dB associated gain at 5 V and 5 mA bias. High gain capability at 1 V and 1 mA makes this device a good fit for 900 MHz pager applications. A good noise match near 50 ohms at 900 MHz makes this a very user-friendly device. Moreover, voltage breakdowns are high enough to support operation at 10 V.

The AT-41532 belongs to Avago's AT-4XXXX series bipolar transistors. It exhibits excellent device uniformity, performance, and reliability as a result of ion-implantation, self-alignment techniques, and gold metalization in the fabrication process.

### 3-Lead SC-70 (SOT-323)

Surface Mount Plastic Package

### Pin Configuration

### Features

- General Purpose NPN Bipolar Transistor Optimized for Low Current, Low Voltage Applications at 900 MHz, 1.8 GHz, and 2.4 GHz
- Performance (5 V, 5 mA)
  - 0.9 GHz: 1 dB NF, 15.5 dB GA
  - 1.8 GHz: 1.4 dB NF, 10.5 dB GA
  - 2.4 GHz: 1.9 dB NF, 9 dB GA
- Characterized for 3, 5, and 8V Use
- Miniature 3-lead SOT-323 (SC-70) Plastic Package
- High Breakdown Voltage (can be operated up to 10 V)
- Lead-free

### Applications

- LNA, Oscillator, Driver Amplifier, Buffer Amplifier, and Down Converter for Cellular and PCS Handsets and Cordless Telephones
- LNA, Oscillator, Mixer, and Gain Amplifier for Pagers
- Power Amplifier and Oscillator for RF-ID Tag
- LNA and Gain Amplifier for GPS
- LNA for CATV Set-Top Box

## AT-41532 Absolute Maximum Ratings

Symbol	Parameter	Units	Absolute Maximum <sup>[1]</sup>
V <sub>EBO</sub>	Emitter-Base Voltage	V	1.5
V <sub>CBO</sub>	Collector-Base Voltage	V	20
V <sub>CEO</sub>	Collector-Emitter Voltage	V	12
I <sub>C</sub>	Collector Current	mA	50
P <sub>T</sub>	Power Dissipation <sup>[2, 3]</sup>	mW	225
T <sub>j</sub>	Junction Temperature	°C	150
T <sub>STG</sub>	Storage Temperature	°C	-65 to 150

Thermal Resistance<sup>[2]</sup>:  
 $\theta_{jc} = 350^{\circ}\text{C/W}$

Notes:

1. Operation of this device above any one of these parameters may cause permanent damage.
2. T<sub>MOUNTING SURFACE</sub> = 25°C.
3. Derate at 2.86 mW/°C for T<sub>MOUNTING SURFACE</sub> > 72°C.

## Electrical Specifications, T<sub>A</sub> = 25°C

Symbol	Parameters and Test Conditions	Units	Min	Typ	Max
h <sub>FE</sub>	Forward Current Transfer Ratio V <sub>CE</sub> = 5 V, I <sub>C</sub> = 5 mA	–	30	150	270
I <sub>CBO</sub>	Collector Cutoff Current V <sub>CB</sub> = 3 V	mA			0.2
I <sub>EBO</sub>	Emitter Cutoff Current V <sub>EB</sub> = 1 V	mA			1.0

## Characterization Information, T<sub>A</sub> = 25°C

Symbol	Parameters and Test Conditions	Units	Min	Typ
NF	Noise Figure V <sub>CE</sub> = 5 V, I <sub>C</sub> = 5 mA	f = 0.9 GHz	dB	1.0
		f = 1.8 GHz		1.4
		f = 2.4 GHz		1.9
G <sub>A</sub>	Associated Gain V <sub>CE</sub> = 5 V, I <sub>C</sub> = 5 mA	f = 0.9 GHz	dB	15.5
		f = 1.8 GHz		10.5
		f = 2.4 GHz		9.0
P <sub>1dB</sub>	Power at 1 dB Gain Compression (opt tuning) V <sub>CE</sub> = 5 V, I <sub>C</sub> = 25 mA	f = 0.9 GHz	dBm	14.5
G <sub>1dB</sub>	Gain at 1 dB Gain Compression (opt tuning) V <sub>CE</sub> = 5 V, I <sub>C</sub> = 25 mA	f = 0.9 GHz	dB	14.5
IP <sub>3</sub>	Output Third Order Intercept Point (opt tuning) V <sub>CE</sub> = 5 V, I <sub>C</sub> = 25 mA	f = 0.9 GHz	dBm	25
S <sub>21E</sub>   <sup>2</sup>	Gain in 50 Ω System V <sub>CE</sub> = 5 V, I <sub>C</sub> = 5 mA	f = 0.9 GHz	dB	12.5
		f = 2.4 GHz		5.2

## AT-41532 Application Information

The AT-41532 is described in a low noise amplifier for use in the 800 to 900 MHz frequency range. The amplifier is designed for use with .032 inch thickness FR-4 printed circuit board material.

### 900 MHz LNA Design

The amplifier is designed for a  $V_{CE}$  of 5 volts and  $I_C$  of 5 mA, and a minimum power supply voltage of 5.25 volts. Higher power supply voltages will require an additional resistance to be inserted at the power supply terminal. The amplifier schematic is shown in Figure 16.

A component list is shown in Figure 17. The artwork including component placement is shown in Figure 18.

Figure 16. Schematic Diagram.

C1,C4	10 pF chip capacitor
C2	Open circuited stub – see text
C3	2.7 pF chip capacitor
C5	1000 pF chip capacitor
L1	8 nH chip inductor (Coilcraft 1008CS-080)
L2	Optional (see R1)
L3	15 nH chip inductor (Coilcraft 1008CS-150)
Q1	Avago AT-41532 Silicon Bipolar Transistor
R1	10K $\Omega$ chip resistor (may want to substitute a 180 nH chip inductor and 50 $\Omega$ resistor for lower noise figure, better low freq stability, then readjust R2)
R2	48 K $\Omega$ chip resistor (adjust for rated $I_C$ )
R3	3.32 K $\Omega$ chip resistor
R4	3.32 K $\Omega$ chip resistor
R5	51.1 $\Omega$ chip resistor
R6	1.1K $\Omega$ chip resistor (see text)
Z <sub>o</sub>	50 $\Omega$ microstripline

Figure 17. Component Parts List.

Figure 18. 1X Artwork showing Component Placement.

The input matching network uses a series inductor for the noise match. Some fine tuning for lowest noise figure and improved input VSWR can be accomplished by adding capacitance at C2. The shunt C is accomplished with an open circuited stub while a chip inductor is used for the series element. The output impedance matching network is a high pass structure consisting of a series capacitor and shunt inductor. A resistor is paralleled across the shunt inductor to enhance broad band stability through 10 GHz. Bias insertion is accomplished through the use of the shunt inductor appropriately bypassed. Surface mount Coilcraft inductors were chosen for their small size.

### Biasing

The bias network is designed for a nominal power supply voltage of 5.25 volts. Resistors R1 and R2 are used to adjust collector current. Resistor R4 can be attached to the junction of R5 and C5 to improve bias point stability.

## Performance

The measured gain of the completed amplifier is shown in Figure 19. The gain varies

from 14 to 15 dB over the 800 to 900 MHz frequency range. Noise figure versus frequency is shown in Figure 20. Best performance occurs at 850 MHz providing a near 1 dB noise figure.

Measured input and output return loss is shown in Figure 21. The input return loss is 10 dB at 850 MHz and can be improved with slight tuning at C2. Output return loss was measured at almost 10 dB at 850 MHz.

There is considerable tuning interaction between input and output matching networks in any single stage amplifier. Having a somewhat better input return loss coincident with low noise figure may necessitate a compromise in output return loss.

Output intercept point,  $IP_3$ , was measured at 850 MHz to be +12 dBm. Removing the 1.1 k $\Omega$  resistor at R6 increases  $IP_3$  to +13.6 dBm. Resistor R6 was originally added to enhance stability; caution is urged when removing this resistor or increasing its value without careful analysis. Another alternative to the shunt resistor R6 would be to incorporate a resistor in series with the transistor collector lead. This resistor would be in the 10 to 27 $\Omega$  range and has similar effects on circuit stability. A third alternative is to re-optimize the output match for power as opposed to matching for lowest output VSWR. This may make the output return loss less than 10 dB but it would enhance power output.

## Modifications to Original Demo Board

The original demo board dated 01/98 requires some modification to work as described in this application note. The modification is to add resistor R6 in series with the collector lead. This is accomplished by cutting the etch at the output of Q1 such that resistor R6 can be placed on the circuit board as shown in Figure 17. Inductor L3 will then have to be placed at a 90 degree angle with respect to its original intended location. L3 is then connected to the junction of R6 and L4 with a small piece of wire or etch.

## Using the AT-41532 at Other Frequencies

The demo board and design techniques presented here can be used to build low noise amplifiers for other frequencies in the VHF through 1.9 GHz frequency range.
