

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## Features

- 80C52X2 Core (6 Clocks per Instruction)
  - Maximum Core Frequency 48 MHz in X1 Mode, 24 MHz in X2 Mode
  - Dual Data Pointer
  - Full-duplex Enhanced UART (EUART), TxD and RxD are 5 Volt Tolerant
  - Three 16-bit Timer/Counters: T0, T1 and T2
  - 256 Bytes of Scratchpad RAM
- 8/16/32-Kbyte On-chip ROM
- 512 byte or 32-Kbyte EEPROM<sup>(1)</sup>
- On-chip Expanded RAM (ERAM): 1024 Bytes
- Integrated Power Monitor (POR/PFD) to Supervise Internal Power Supply
- USB 2.0 Full Speed Compliant Module with Interrupt on Transfer Completion (12Mbps)
  - Endpoint 0 for Control Transfers: 32-byte FIFO
  - 6 Programmable Endpoints with In or Out Directions and with Bulk, Interrupt or Isochronous Transfers
    - Endpoint 1, 2, 3: 32-byte FIFO
    - Endpoint 4, 5: 2 x 64-byte FIFO with Double Buffering (Ping-pong Mode)
  - Suspend/Resume Interrupts
  - Power-on Reset and USB Bus Reset
  - 48 MHz DPLL for Full-speed Bus Operation
  - USB Bus Disconnection on Microcontroller Request
- 5 Channels Programmable Counter Array (PCA) with 16-bit Counter, High-speed Output, Compare/Capture, PWM and Watchdog Timer Capabilities
- Programmable Hardware Watchdog Timer (One-time Enabled with Reset-out): 50 ms to 6s at 4 MHz
- Keyboard Interrupt Interface on Port P1 (8 Bits)
- TWI (Two Wire Interface) 400Kbit/s
- SPI Interface (Master/Slave Mode) MISO, MOSI, SCK and SS are 5 Volt Tolerant
- 34 I/O Pins
- 4 Direct-drive LED Outputs with Programmable Current Sources: 2-6-10 mA Typical
- 4-level Priority Interrupt System (11 sources)
- Idle and Power-down Modes
- 0 to 32 MHz On-chip Oscillator with Analog PLL for 48 MHz Synthesis
- Industrial Temperature Range
- Low Voltage Range Supply: 2.7V to 3.6V
- Packages: Die SO28, QFN32, MLF48, TQFP64

Notes: 1. EEPROM only available on MLF48

## 1. Description

AT83C5134/35/36 are high performance ROM versions of the 80C51 single-chip 8-bit microcontrollers with full speed USB functions.

AT83C5134/35 is pin compatible with AT89C5130A 16-Kbytes In-System Programmable Flash microcontrollers.

**8-bit  
Microcontroller  
with Full Speed  
USB Device**

**AT83C5134  
AT83C5135  
AT83C5136**

This allows to use AT89C5130A for development, pre-production and flexibility, while using AT83C5134/35 for cost reduction in mass production. Similarly AT83C5136 is pin compatible with AT89C5131A 32-Kbytes Flash microcontroller.

AT83C5134/35/36 features a full-speed USB module compatible with the USB specifications Version 2.0. This module integrates the USB transceivers and the Serial Interface Engine (SIE) with Digital Phase Locked Loop and 48 MHz clock recovery. USB Event detection logic (Reset and Suspend/Resume) and FIFO buffers supporting the mandatory control Endpoint (EP0) and 5 versatile Endpoints (EP1/EP2/EP3/EP4/EP5) with minimum software overhead are also part of the USB module.

AT83C5134/35/36 retains the features of the Atmel 80C52 with extended ROM capacity (8/16/32 Kbytes), 256 bytes of internal RAM, a 4-level interrupt system, two 16-bit timer/counters (T0/T1), a full duplex enhanced UART (EUSART) and an on-chip oscillator.

In addition, AT83C5134/35/36 has an on-chip expanded RAM of 1024 bytes (ERAM), a dual-data pointer, a 16-bit up/down Timer (T2), a Programmable Counter Array (PCA), up to 4 programmable LED current sources, a programmable hardware watchdog and a power-on reset.

AT83C5134/35/36 has two software-selectable modes of reduced activity for further reduction in power consumption. In the idle mode the CPU is frozen while the timers, the serial ports and the interrupt system are still operating. In the power-down mode the RAM is saved, the peripheral clock is frozen, but the device has full wake-up capability through USB events or external interrupts.

## 4.2 Signals

All the AT83C5134/35/36 signals are detailed by functionality on Table 4-1 through Table 4-12.

**Table 4-1.** Keypad Interface Signal Description

Signal Name	Type	Description	Alternate Function
KIN[7:0]	I	<b>Keypad Input Lines</b> Holding one of these pins high or low for 24 oscillator periods triggers a keypad interrupt if enabled. Held line is reported in the KBCON register.	P1[7:0]

**Table 4-2.** Programmable Counter Array Signal Description

Signal Name	Type	Description	Alternate Function
ECI	I	External Clock Input	P1.2
CEX[4:0]	I/O	Capture External Input Compare External Output	P1.3 P1.4 P1.5 P1.6 P1.7

**Table 4-3.** Serial I/O Signal Description

Signal Name	Type	Description	Alternate Function
RxD	I	Serial Input The serial input for Extended UART. This I/O is 5 Volt Tolerant.	P3.0
TxD	O	<b>Serial Output</b> The serial output for Extended UART. This I/O is 5 Volt Tolerant.	P3.1

**Table 4-4.** Timer 0, Timer 1 and Timer 2 Signal Description

Signal Name	Type	Description	Alternate Function
INT0	I	<b>Timer 0 Gate Input</b> INT0 serves as external run control for timer 0, when selected by GATE0 bit in TCON register. <b>External Interrupt 0</b> INT0 input set IE0 in the TCON register. If bit IT0 in this register is set, bits IE0 are set by a falling edge on INT0. If bit IT0 is cleared, bits IE0 is set by a low level on INT0.	P3.2
INT1	I	<b>Timer 1 Gate Input</b> INT1 serves as external run control for Timer 1, when selected by GATE1 bit in TCON register. <b>External Interrupt 1</b> INT1 input set IE1 in the TCON register. If bit IT1 in this register is set, bits IE1 are set by a falling edge on INT1. If bit IT1 is cleared, bits IE1 is set by a low level on INT1.	P3.3
T0	I	<b>Timer Counter 0 External Clock Input</b> When Timer 0 operates as a counter, a falling edge on the T0 pin increments the count.	P3.4
T1	I	<b>Timer/Counter 1 External Clock Input</b> When Timer 1 operates as a counter, a falling edge on the T1 pin increments the count.	P3.5
T2	I O	Timer/Counter 2 External Clock Input Timer/Counter 2 Clock Output	P1.0
T2EX	I	Timer/Counter 2 Reload/Capture/Direction Control Input	P1.1

**Table 4-5.** LED Signal Description

Signal Name	Type	Description	Alternate Function
LED[3:0]	O	<b>Direct Drive LED Output</b> These pins can be directly connected to the Cathode of standard LEDs without external current limiting resistors. The typical current of each output can be programmed by software to 2, 6 or 10 mA. Several outputs can be connected together to get higher drive capabilities.	P3.3 P3.5 P3.6 P3.7

**Table 4-6. TWI Signal Description**

Signal Name	Type	Description	Alternate Function
SCL	I/O	<b>SCL: TWI Serial Clock</b> SCL output the serial clock to slave peripherals. SCL input the serial clock from master.	P4.0
SDA	I/O	<b>SDA: TWI Serial Data</b> SCL is the bidirectional TWI data line.	P4.1

**Table 4-7. SPI Signal Description**

Signal Name	Type	Description	Alternate Function
SS	I/O	<b>SS</b> : SPI Slave Select . This I/O is 5 Volt tolerant	P1.1
MISO	I/O	<b>MISO</b> : SPI Master Input Slave Output line When SPI is in master mode, MISO receives data from the slave peripheral. When SPI is in slave mode, MISO outputs data to the master controller. This I/O is 5 Volt tolerant	P1.5
SCK	I/O	<b>SCK</b> : SPI Serial Clock SCK outputs clock to the slave peripheral or receive clock from the master. This I/O is 5 Volt tolerant.	P1.6
MOSI	I/O	<b>MOSI</b> : SPI Master Output Slave Input line When SPI is in master mode, MOSI outputs data to the slave peripheral. When SPI is in slave mode, MOSI receives data from the master controller. This I/O is 5 Volt tolerant.	P1.7

**Table 4-8. Ports Signal Description**

Signal Name	Type	Description	Alternate Function
P0[7:0]	I/O	<b>Port 0</b> P0 is an 8-bit open-drain bidirectional I/O port. Port 0 pins that have 1s written to them float and can be used as high impedance inputs. To avoid any parasitic current consumption, Floating P0 inputs must be pulled to $V_{DD}$ or $V_{SS}$ .	AD[7:0]
P1[7:0]	I/O	<b>Port 1</b> P1 is an 8-bit bidirectional I/O port with internal pull-ups.	KIN[7:0] T2 T2EX ECI CEX[4:0]
P2[7:0]	I/O	<b>Port 2</b> P2 is an 8-bit bidirectional I/O port with internal pull-ups.	A[15:8]

Signal Name	Type	Description	Alternate Function
P3[7:0]	I/O	<b>Port 3</b> P3 is an 8-bit bidirectional I/O port with internal pull-ups.	LED[3:0] RxD TxD $\overline{\text{INT0}}$ $\overline{\text{INT1}}$ T0 T1 $\overline{\text{WR}}$ RD
P4[1:0]	I/O	<b>Port 4</b> P4 is an 2-bit open port.	SCL SDA

**Table 4-9.** Clock Signal Description

Signal Name	Type	Description	Alternate Function
XTAL1	I	<b>Input to the on-chip inverting oscillator amplifier</b> To use the internal oscillator, a crystal/resonator circuit is connected to this pin. If an external oscillator is used, its output is connected to this pin.	-
XTAL2	O	<b>Output of the on-chip inverting oscillator amplifier</b> To use the internal oscillator, a crystal/resonator circuit is connected to this pin. If an external oscillator is used, leave XTAL2 unconnected.	-
PLLFB	I	<b>PLL Low Pass Filter input</b> Receives the RC network of the PLL low pass filter (See Figure 5-1 on page 11 ).	-

**Table 4-10.** USB Signal Description

Signal Name	Type	Description	Alternate Function
D+	I/O	USB Data + signal Set to high level under reset.	-
D-	I/O	USB Data - signal Set to low level under reset.	-
VREF	O	<b>USB Reference Voltage</b> Connect this pin to D+ using a 1.5 kΩ resistor to use the Detach function.	-

**Table 4-11.** System Signal Description

Signal Name	Type	Description	Alternate Function
AD[7:0]	I/O	Multiplexed Address/Data LSB for external access Data LSB for Slave port access (used for 8-bit and 16-bit modes)	P0[7:0]
A[15:8]	I/O	Address Bus MSB for external access Data MSB for Slave port access (used for 16-bit mode only)	P2[7:0]

Signal Name	Type	Description	Alternate Function
RD	I/O	<b>Read Signal</b> Read signal asserted during external data memory read operation. Control input for slave port read access cycles.	P3.7
WR	I/O	<b>Write Signal</b> Write signal asserted during external data memory write operation. Control input for slave write access cycles.	P3.6
RST	I/O	<b>Reset</b> Holding this pin low for 64 oscillator periods while the oscillator is running resets the device. The Port pins are driven to their reset conditions when a voltage lower than $V_{IL}$ is applied, whether or not the oscillator is running. This pin has an internal pull-up resistor which allows the device to be reset by connecting a capacitor between this pin and VSS. Asserting RST when the chip is in Idle mode or Power-down mode returns the chip to normal operation. This pin is set to 0 for at least 12 oscillator periods when an internal reset occurs (hardware watchdog or Power monitor).	-
ALE	O	<b>Address Latch Enable Output</b> The falling edge of ALE strobes the address into external latch. This signal is active only when reading or writing external memory using MOVX instructions.	-
PSEN	O	Program Strobe Enable / Hardware conditions Input for ISP Used as input under reset to detect external hardware conditions of ISP mode	-
EA	I	External Access Enable This pin must be held low to force the device to fetch code from external program memory starting at address 0000h. It is latched during reset and cannot be dynamically changed during operation.	-

**Table 4-12.** Power Signal Description

Signal Name	Type	Description	Alternate Function
AVSS	GND	<b>Alternate Ground</b> AVSS is used to supply the on-chip PLL and the USB PAD.	-
AVDD	PWR	<b>Alternate Supply Voltage</b> AVDD is used to supply the on-chip PLL and the USB PAD.	-
VSS	GND	<b>Digital Ground</b> VSS is used to supply the buffer ring and the digital core.	-
VDD	PWR	<b>Digital Supply Voltage</b> VDD is used to supply the buffer ring on all versions of the device. It is also used to power the on-chip voltage regulator of the Standard versions or the digital core of the Low Power versions.	-
VREF	O	USB pull-up Controlled Output VREF is used to control the USB D+ 1.5 k $\Omega$ pull up. The Vref output is in high impedance when the bit DETACH is set in the USBCON register.	-

## 5. Typical Application

### 5.1 Recommended External components

All the external components described in the figure below must be implemented as close as possible from the microcontroller package.

The following figure represents the typical wiring schematic.

Figure 5-1. Typical Application

## 5.2 PCB Recommendations

Figure 5-2. USB Pads

Note: No sharp angle in above drawing.

Figure 5-3. USB PLL

## 6. Clock Controller

### 6.1 Introduction

The AT83C5134/35/36 clock controller is based on an on-chip oscillator feeding an on-chip Phase Lock Loop (PLL). All the internal clocks to the peripherals and CPU core are generated by this controller.

The AT83C5134/35/36 X1 and X2 pins are the input and the output of a single-stage on-chip inverter (see Figure 6-1) that can be configured with off-chip components as a Pierce oscillator (see Figure 6-2). Value of capacitors and crystal characteristics are detailed in the section “DC Characteristics”.

The X1 pin can also be used as input for an external 48 MHz clock.

The clock controller outputs three different clocks as shown in Figure 6-1:

- a clock for the CPU core
- a clock for the peripherals which is used to generate the Timers, PCA, WD, and Port sampling clocks
- a clock for the USB controller

These clocks are enabled or disabled depending on the power reduction mode as detailed in Section “Power Management”, page 135.

Figure 6-1. Oscillator Block Diagram

### 6.2 Oscillator

Two clock sources are available for CPU:

- Crystal oscillator on X1 and X2 pins: Up to 32 MHz
- External 48 MHz clock on X1 pin

In order to optimize the power consumption, the oscillator inverter is inactive when the PLL output is not selected for the USB device.

**Figure 6-2.** Crystal Connection

## 6.3 PLL

### 6.3.1 PLL Description

The AT83C5134/35/36 PLL is used to generate internal high frequency clock (the USB Clock) synchronized with an external low-frequency (the Peripheral Clock). The PLL clock is used to generate the USB interface clock. Figure 6-3 shows the internal structure of the PLL.

The PFLD block is the Phase Frequency Comparator and Lock Detector. This block makes the comparison between the reference clock coming from the N divider and the reverse clock coming from the R divider and generates some pulses on the Up or Down signal depending on the edge position of the reverse clock. The PLEN bit in PLLCON register is used to enable the clock generation. When the PLL is locked, the bit PLOCK in PLLCON register (see Figure 6-3) is set.

The CHP block is the Charge Pump that generates the voltage reference for the VCO by injecting or extracting charges from the external filter connected on PLLF pin (see Figure 6-4). Value of the filter components are detailed in the Section “DC Characteristics”.

The VCO block is the Voltage Controlled Oscillator controlled by the voltage  $V_{REF}$  produced by the charge pump. It generates a square wave signal: the PLL clock.

**Figure 6-3.** PLL Block Diagram and Symbol

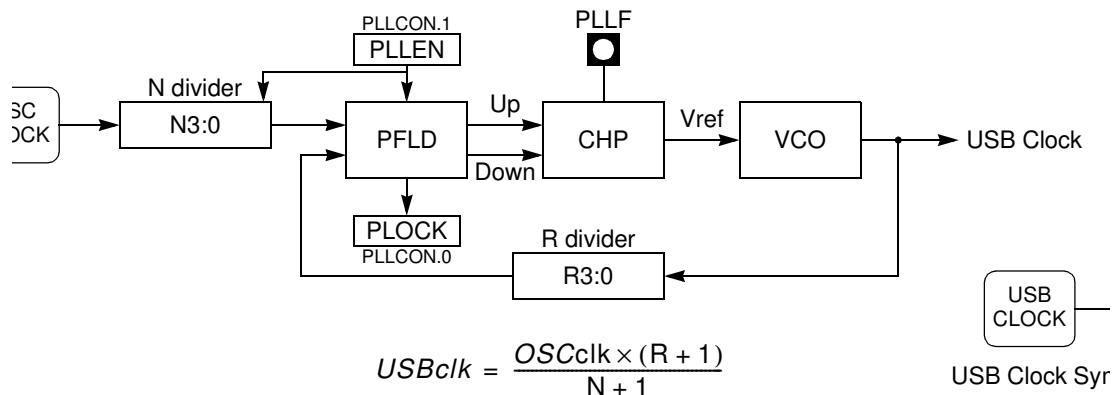

Figure 6-4. PLL Filter Connection

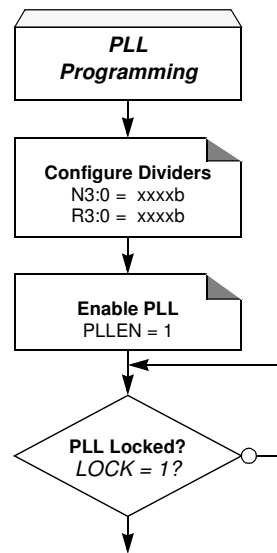

The typical values are: R = 560 Ω, C1 = 820 pf, C2 = 150 pF.

6.3.2 PLL Programming

The PLL is programmed using the flow shown in Figure 6-5. As soon as clock generation is enabled user must wait until the lock indicator is set to ensure the clock output is stable.

Figure 6-5. PLL Programming Flow

6.3.3 Divider Values

To generate a 48 MHz clock using the PLL, the divider values have to be configured following the oscillator frequency. The typical divider values are shown in Table 6-1.

Table 6-1. Typical Divider Values

Oscillator Frequency	R+1	N+1	PLLDIV
3 MHz	16	1	F0h
6 MHz	8	1	70h
8 MHz	6	1	50h
12 MHz	4	1	30h
16 MHz	3	1	20h
18 MHz	8	3	72h
20 MHz	12	5	B4h
24 MHz	2	1	10h

Oscillator Frequency	R+1	N+1	PLLDIV
32 MHz	3	2	21h
40 MHz	12	10	B9h

## 6.4 Registers

**Table 6-2.** CKCON0 (S:8Fh)  
Clock Control Register 0

7	6	5	4	3	2	1	0
TWIX2	WDX2	PCAX2	SIX2	T2X2	T1X2	T0X2	X2
Bit Number	Bit Mnemonic	Description					
7	TWIX2	<b>TWI Clock</b> <b>This control bit is validated when the CPU clock X2 is set. When X2 is low, this bit has no effect.</b> Clear to select 6 clock periods per peripheral clock cycle. Set to select 12 clock periods per peripheral clock cycle.					
6	WDX2	<b>Watchdog Clock</b> <b>This control bit is validated when the CPU clock X2 is set. When X2 is low, this bit has no effect.</b> Clear to select 6 clock periods per peripheral clock cycle. Set to select 12 clock periods per peripheral clock cycle.					
5	PCAX2	<b>Programmable Counter Array Clock</b> <b>This control bit is validated when the CPU clock X2 is set. When X2 is low, this bit has no effect.</b> Clear to select 6 clock periods per peripheral clock cycle. Set to select 12 clock periods per peripheral clock cycle.					
4	SIX2	<b>Enhanced UART Clock (Mode 0 and 2)</b> <b>This control bit is validated when the CPU clock X2 is set. When X2 is low, this bit has no effect.</b> Clear to select 6 clock periods per peripheral clock cycle. Set to select 12 clock periods per peripheral clock cycle.					
3	T2X2	<b>Timer2 Clock</b> <b>This control bit is validated when the CPU clock X2 is set. When X2 is low, this bit has no effect.</b> Clear to select 6 clock periods per peripheral clock cycle. Set to select 12 clock periods per peripheral clock cycle.					
2	T1X2	<b>Timer1 Clock</b> <b>This control bit is validated when the CPU clock X2 is set. When X2 is low, this bit has no effect.</b> Clear to select 6 clock periods per peripheral clock cycle. Set to select 12 clock periods per peripheral clock cycle.					
1	T0X2	<b>Timer0 Clock</b> <b>This control bit is validated when the CPU clock X2 is set. When X2 is low, this bit has no effect.</b> Clear to select 6 clock periods per peripheral clock cycle. Set to select 12 clock periods per peripheral clock cycle.					
0	X2	<b>System Clock Control bit</b> Clear to select 12 clock periods per machine cycle (STD mode, $F_{CPU} = F_{PER} = F_{OSC}/2$ ). Set to select 6 clock periods per machine cycle (X2 mode, $F_{CPU} = F_{PER} = F_{OSC}$ ).					

Reset Value = 0000 0000b

Reset Value = 0000 0000

## 7. SFR Mapping

The Special Function Registers (SFRs) of the AT83C5134/35/36 fall into the following categories:

- C51 core registers: ACC, B, DPH, DPL, PSW, SP
- I/O port registers: P0, P1, P2, P3, P4
- Timer registers: T2CON, T2MOD, TCON, TH0, TH1, TH2, TMOD, TL0, TL1, TL2, RCAP2L, RCAP2H
- Serial I/O port registers: SADDR, SADEN, SBUF, SCON
- PCA (Programmable Counter Array) registers: CCON, CMOD, CCAPMx, CL, CH, CCAPxH, CCAPxL (x: 0 to 4)
- Power and clock control registers: PCON
- Hardware Watchdog Timer registers: WDTRST, WDTPRG
- Interrupt system registers: IEN0, IPL0, IPH0, IEN1, IPL1, IPH1
- Keyboard Interface registers: KBE, KBF, KBLS
- LED register: LEDCON
- Two Wire Interface (TWI) registers: SCON, SSCS, SSDAT, SSADR
- Serial Port Interface (SPI) registers: SPCON, SPSTA, SPDAT
- USB registers: Uxxx (17 registers)
- PLL registers: PLLCON, PLLDIV
- BRG (Baud Rate Generator) registers: BRL, BDRCON
- Others: AUXR, AUXR1, CKCON0, CKCON1

The table below shows all SFRs with their address and their reset value.

**Table 7-1. SFR Descriptions**

The Special Function Registers (SFRs) of the AT89C5131 fall into the following categories:

**Table 7-2. C51 Core SFRs**

Mnemonic	Add	Name	7	6	5	4	3	2	1	0
ACC	E0h	Accumulator								
B	F0h	B Register								
PSW	D0h	Program Status Word								
SP	81h	Stack Pointer LSB of SPX								
DPL	82h	Data Pointer Low byte LSB of DPTR								
DPH	83h	Data Pointer High byte MSB of DPTR								

**Table 7-3. I/O Port SFRs**

Mnemonic	Add	Name	7	6	5	4	3	2	1	0
P0	80h	Port 0								
P1	90h	Port 1								
P2	A0h	Port 2								
P3	B0h	Port 3								
P4	C0h	Port 4 (2bits)								

**Table 7-4. Timer SFR's**

Mnemonic	Add	Name	7	6	5	4	3	2	1	0
TH0	8Ch	Timer/Counter 0 High byte								
TL0	8Ah	Timer/Counter 0 Low byte								
TH1	8Dh	Timer/Counter 1 High byte								
TL1	8Bh	Timer/Counter 1 Low byte								
TH2	CDh	Timer/Counter 2 High byte								
TL2	CCh	Timer/Counter 2 Low byte								
TCON	88h	Timer/Counter 0 and 1 control	TF1	TR1	TF0	TR0	IE1	IT1	IE0	IT0
TMOD	89h	Timer/Counter 0 and 1 Modes	GATE1	C/T1#	M11	M01	GATE0	C/T0#	M10	M00
T2CON	C8h	Timer/Counter 2 control	TF2	EXF2	RCLK	TCLK	EXEN2	TR2	C/T2#	CP/RL2#
T2MOD	C9h	Timer/Counter 2 Mode							T2OE	DCEN

## 8. Program/Code Memory

The AT83C5134/35/36 implement 16 or 32 Kbytes of on-chip program/code memory. Figure 8-1 shows the split of internal and external program/code memory spaces depending on the product.

**Figure 8-1.** Program/Code Memory Organization

Note: If the program executes exclusively from on-chip code memory (not from external memory), beware of executing code from the upper byte of on-chip memory and thereby disrupting I/O Ports 0 and 2 due to external prefetch. Fetching code constant from this location does not affect Ports 0 and 2.

### 8.1 External Code Memory Access

#### 8.1.1 Memory Interface

The external memory interface comprises the external bus (Port 0 and Port 2) as well as the bus control signals ( $\overline{\text{PSEN}}$ , and ALE).

Figure 8-2 shows the structure of the external address bus. P0 carries address A7:0 while P2 carries address A15:8. Data D7:0 is multiplexed with A7:0 on P0. Table 8-1 describes the external memory interface signals.

**Figure 8-2.** External Code Memory Interface Structure
