5.1 Absolute Maximum Ratings

Stresses beyond those listed in this section may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 5-1. Absolute Maximum Ratings

Symbol	Description	Conditions	Min.	Max.	Unit
V _{DD}	Power Supply Voltage		-0.5	6	V
I _{VDD}	Current into a V _{DD} pin	T _A =[-40, 85]°C	-	200	mA
		T _A =[85, 125]°C	-	100	mA
I _{GND}	Current out of a GND pin	T _A =[-40, 85]°C	-	200	mA
		T _A =[85, 125]°C	-	100	mA
V _{PIN}	Pin voltage with respect to GND		-0.5	V _{DD} +0.5	V
I _{PIN}	I/O pin sink/source current		-40	40	mA
I _{c1} ⁽¹⁾	I/O pin injection current except for the RESET pin	V _{pin} <GND-0.6V or 5.5V<V _{pin} ≤6.1V 4.9V<V _{DD} ≤5.5V	-1	1	mA
I _{c2} ⁽¹⁾	I/O pin injection current except for the RESET pin	V _{pin} <GND-0.6V or V _{pin} ≤5.5V V _{DD} ≤4.9V	-15	15	mA
T _{storage}	Storage temperature		-65	150	°C

Note:

- If V_{PIN} is lower than GND-0.6V, then a current limiting resistor is required. The negative DC injection current limiting resistor is calculated as R = (GND-0.6V – V_{pin})/I_{Cn}.
 - If V_{PIN} is greater than V_{DD}+0.6V, then a current limiting resistor is required. The positive DC injection current limiting resistor is calculated as R = (V_{pin}-(V_{DD}+0.6))/I_{Cn}.

5.2 General Operating Ratings

The device must operate within the ratings listed in this section in order for all other electrical characteristics and typical characteristics of the device to be valid.

Table 5-2. General Operating Conditions

Symbol	Description	Condition	Min.	Max.	Unit
V _{DD}	Operating Supply Voltage		1.8 ⁽¹⁾	5.5	V
T _A	Operating temperature range	Standard temperature range	-40	125	°C

Note:

1. Operation is guaranteed down to 1.8V or VBOD with BODEVEL=1.8V, whichever is lower.

Electrical Characteristics

Table 5-3. Operating Voltage and Frequency

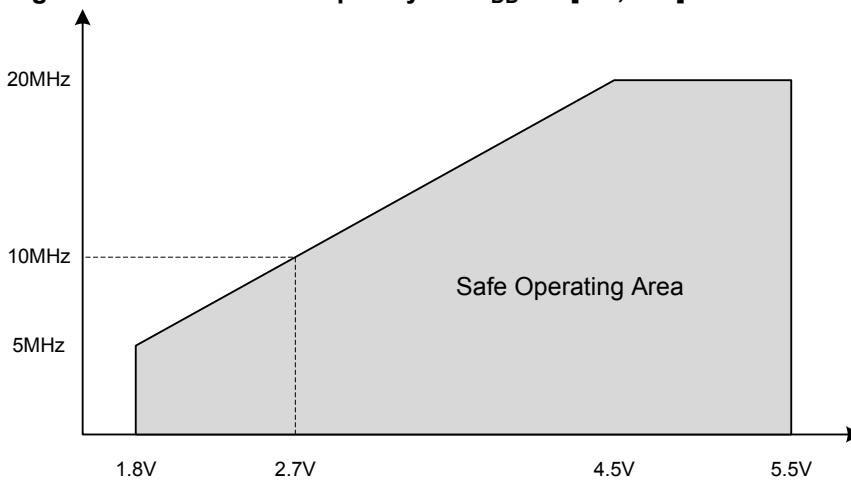

Symbol	Description	Condition	Min.	Max. ⁽¹⁾	Unit
f_{CLK_CPU}	Nominal operating system clock frequency	$V_{DD}=[1.8, 5.5]V$ $T_A=[-40, 105]^\circ C$ ⁽²⁾	0	5	MHz
		$V_{DD}=[2.7, 5.5]V$ $T_A=[-40, 105]^\circ C$ ⁽³⁾	0	10	
		$V_{DD}=[4.5, 5.5]V$ $T_A=[-40, 105]^\circ C$ ⁽⁴⁾	0	20	
		$V_{DD}=[2.7, 5.5]V$ $T_A=[-40, 125]^\circ C$ ⁽³⁾	0	8	
		$V_{DD}=[4.5, 5.5]V$ $T_A=[-40, 125]^\circ C$ ⁽³⁾	0	16	

Note:

1. Operation is guaranteed 5% above the maximum frequency.
2. Operation is guaranteed down to BOD triggering level, V_{BOD} with $BODLEVEL=1.8V$.
3. Operation is guaranteed down to BOD triggering level, V_{BOD} with $BODLEVEL=2.7V$.
4. Operation is guaranteed down to BOD triggering level, V_{BOD} with $BODLEVEL=4.3V$.

The maximum CPU clock frequency depends on V_{DD} . As shown in the following figure, the Maximum Frequency vs. V_{DD} is linear between $1.8V < V_{DD} < 2.7V$ and $2.7V < V_{DD} < 4.5V$

Figure 5-1. Maximum Frequency vs. V_{DD} for $[-40, 105]^\circ C$

5.3 Power Considerations

The average die junction temperature, T_J (in $^\circ C$) is given from the formula

$$T_J = T_A + P_D * R_{\theta JA}$$

where P_D is the total power dissipation.

The total thermal resistance of a package ($R_{\theta JA}$) can be separated into two components, $R_{\theta JC}$ and $R_{\theta CA}$, representing the barrier to heat flow from the semiconductor junction to the package (case) surface ($R_{\theta JC}$) and from the case to the outside ambient air ($R_{\theta CA}$). These terms are related by the equation:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CA}.$$

$R_{\theta JC}$ is device related and cannot be influenced by the user. However, $R_{\theta CA}$ is user dependent and can be minimized by thermal management techniques such as heat sinks, ambient air cooling, and thermal convection. Thus, good thermal management on the part of the user can significantly reduce $R_{\theta CA}$ so that $R_{\theta JA}$ approximately equals $R_{\theta JC}$.

The power dissipation curve is negatively sloped as ambient temperature increase. The maximum power dissipation is therefore at minimum ambient temperature while the highest junction temperature occurs at the maximum ambient temperature.

Table 5-4. Power Dissipation and Junction Temperature vs Temperature

Package	T _A Range	R _{θJA} (°C/W)	P _D (W) typical	T _J - T _A (°C) typical
QFN48	-40°C to 125°C		1.0	
TQFP48	-40°C to 125°C		1.0
