

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Address: A1208, Overseas Decoration Building, #122 Zhenhua RD., Futian, Shenzhen, China

## Features

- Very Low Power Design (40 mW)
- Single IF Architecture
- Excellent Noise Performance
- 1.5-bit ADC On Chip
- Small QFN Package (4 mm × 4 mm, 24 pins)
- Highly integrated, Few External Components
- Advanced BiCMOS Technology (UHF6s)
- RoHS Compliant

## 1. Description

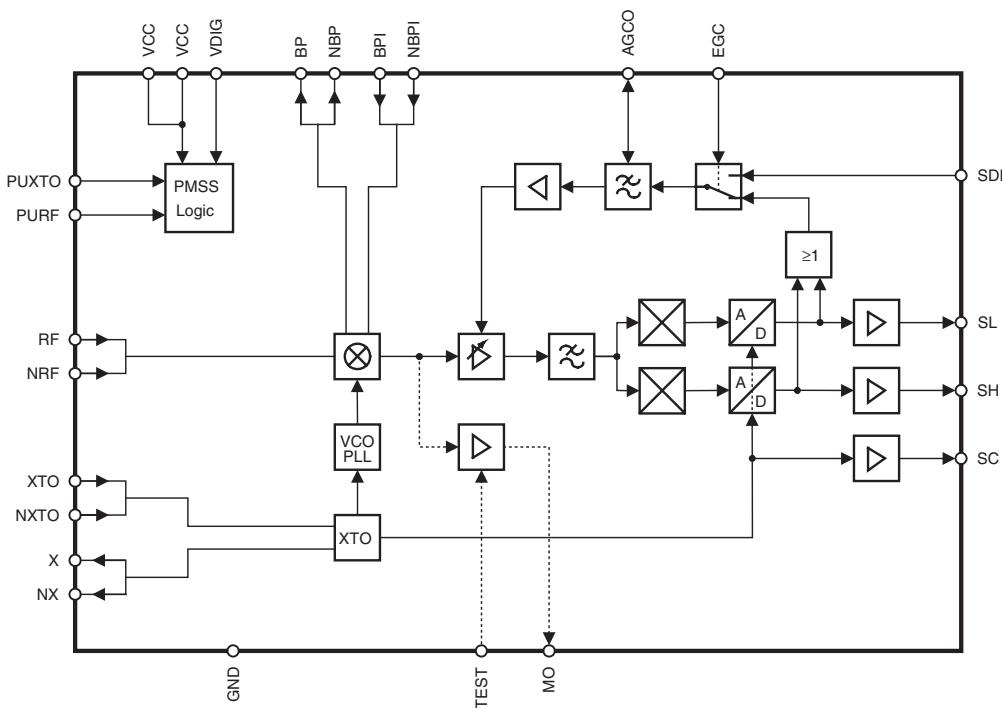

The ATR0601 is a single IF GPS front-end IC, designed to meet the requirements of mobile and automotive applications.

Excellent RF performance combined with low noise figure enables high quality GPS solutions and its very low power consumption fits perfectly to portable devices. Featuring a balanced XTO and a fully integrated balanced frequency synthesizer, only few external components are required.

The ATR0601 offers a complete autonomous mode, utilizing the on chip AGC in closed loop operation, to set the gain of the IF VGA.

Alternatively, in combination with the Antaris™ 4 baseband processor family, the optimum gain of the IF VGA can be computed and set by software, using the digital SDI interface.

## 2. Pin Configuration

Figure 2-1. Pinning QFN24

Table 2-1. Pin Description

Pin	Symbol	Type <sup>(1)</sup>	Function
Paddle	GND	S	Common ground
1	VDIG	S	Digital supply
2	AGCO	A_I/O	AGC: gain control voltage output/corner frequency determination
3	NXTO	A_I	XTO interface (optional: TCXO input)
4	NX	A_O	XTO interface
5	X	A_O	XTO interface
6	XTO	A_I	XTO interface (optional: TCXO input)
7	VCC	S	Analog supply
8	MO	A_O	Testbuffer output ( $f_{IF}$ )
9	TEST	A_I	Enable testbuffer
10	NRF	A_I	RF input complementary
11	RF	A_I	RF input
12	NC	–	Not connected
13	BP	A_O	IF-Filter interface (mixer output, open collector)
14	NBP	A_O	IF-Filter interface (mixer output complementary, open collector)
15	BPI	A_I	IF-Filter interface (IF-input)
16	NBPI	A_I	IF-Filter interface (IF-input complementary)
17	PUXTO	D_I	Power-up XTO
18	PURF	D_I	Power-up RF
19	VCC	S	Analog supply
20	EGC	D_I	Enable external gain control (high = external; low = internal)
21	SDI	D_I	Input for external gain control signal ( $\Sigma\Delta$ modulation)
22	SL	D_O	Data output: “low”
23	SH	D_O	Data output: “high”
24	SC	D_O	Sample clock

Note: 1. Type: A\_I Analog input, A\_O Analog output, D\_I Digital input, D\_O Digital output, S Supply

### 3. Functional Description

#### 3.1 General Description

The ATR0601 GPS receiver IC has been especially designed for GPS applications in both mobile phone and automotive applications. From this system point of view, it incorporates highest isolation between GPS and cellular bands, as well as very low power consumption.

The L1 input signal ( $f_{RF}$ ) is a Direct Sequence Spread Spectrum (DSSS) signal with a centre frequency of:  $f_{RF} = 1575.42$  MHz. The digital modulation scheme is Bi-Phase-Shift-Keying (BPSK) with a chip rate of 1.023 Mbps. As the input signal power at the antenna is approximately  $-140$  dBm, the desired signal is below the thermal noise floor.

#### 3.2 PMSS Logic

The Power Management, Startup and Shutdown Logic ensures reliable operation within the recommended operating and timing conditions. The external power control signals P<sub>Urf</sub> and P<sub>Uxto</sub> are passed thru Schmitt-trigger inputs, digital and analog supply voltages are analyzed by monitoring circuits.

#### 3.3 XTO

The XTO is designed for minimum phase noise and frequency perturbations. The balanced topology gives maximum isolation from external and ground coupled noise. The built-in jump start circuitry ensures reliable start-up behaviour of any specified crystal. For use with an external TCXO, the XTO circuitry can be used as a single-ended or balanced input buffer.

The recommended reference frequency is:  $f_{XTO} = 23.104$  MHz.

#### 3.4 VCO/PLL

The frequency synthesizer features a balanced VCO and a fully integrated loop filter, thus no external components are required. The VCO combines very good phase noise behaviour and excellent spurious suppression. The relation between the reference frequency ( $f_{XTO}$ ) and the VCO centre frequency ( $f_{VCO}$ ) is given by:  $f_{VCO} = f_{XTO} \times 64 = 23.104$  MHz  $\times$  64 = 1478.656 MHz.

#### 3.5 RF-Mixer/Image-filter

Combined with the antenna an external LNA provides a first band-pass filtering of the signal. For the LNA, Atmel's ATR0610 is recommended, due to its low Noise Figure, high linearity and low power consumption. The output of the LNA drives an SAW filter, which provides image rejection for the mixer and the required isolation of all GSM bands. The output of the SAW filter is fed into a highly linear mixer with high conversion gain and excellent noise performance.

The IF frequency ( $f_{IF}$ ) is given by:  $f_{IF} = f_{RF} - f_{VCO} = 1575.42$  MHz  $-$  1478.656 MHz = 96.764 MHz.

#### 3.6 IF-filter

The mixer directly drives an external LC band-pass filter via open collector outputs. In order to provide highest selectivity and conversion gain, it is recommended to design the external filter, according to the application proposal, as a 2-pole filter with a quality factor  $Q > 25$ .

### 3.7 VGA/AGC

The output of the IF-Filter drives an on-chip Variable Gain Amplifier (VGA) which is combined with additional low-pass filtering. The on-chip Automatic Gain Control (AGC) stage sets the gain of the VGA in order to optimally charge the input of the following analog-to-digital converter. The AGC control loop can be selected for on-chip closed loop operation or for external gain control mode. For external gain control mode, the loop needs to be closed by the baseband IC ATR0621.

### 3.8 A/D Converter

The analog-to-digital converter stage has a total resolution of 1.5 bit. It comprises balanced comparators and a sub sampling unit, clocked by the reference frequency ( $f_{XTO}$ ). The frequency spectrum of the digital output signal ( $f_{OUT}$ ), present at the data outputs SL and SH, is then given by:  $f_{OUT} = |f_{IF} - f_{XTO} \times n|$ . The selected sub sampling factor ( $n = 4$ ) leads to the designated digital output signal, with a centre frequency given by:

$$f_{OUT} = f_{IF} - f_{XTO} \times 4 = 96.764 \text{ MHz} - 23.104 \text{ MHz} \times 4 = 4.348 \text{ MHz.}$$

### 3.9 Clock and Data Driver

CMOS output drivers are providing 1.5 bit data (SH, SL) and the system clock (SC). The rail-to-rail output signal level is determined by the digital supply voltage (VDIG).

## 4. Absolute Maximum Ratings

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Parameters	Symbol	Value	Unit
Analog supply voltage	$V_{CC}$	-0.3 to +3.7	V
Digital supply voltage	$V_{DIG}$	-0.3 to +3.7	V
Input voltage	$V_{in}$	-0.3 to +3.7	V
Operating temperature	$T_{op}$	-40 to +85	°C
Storage temperature	$T_{stg}$	-55 to +125	°C

## 5. Thermal Resistance

Parameters	Symbol	Value	Unit
Junction ambient	$R_{th}$	125	K/W

## 6. Operating Range

Parameters	Symbol	Value	Unit
Analog supply voltage	$V_{CC}$	2.70 to 3.30	V
Digital supply voltage	$V_{DIG}$	1.65 to 2.00	V
Supply voltage difference ( $V_{\Delta} = V_{CC} - V_{DIG}$ )	$V_{\Delta}$	$\geq 0.80$	V
Temperature range	Temp	-40 to +85	°C
Input frequency	$f_{RF}$	1575.42	MHz
Reference frequency	$f_{XTO}$	23.104	MHz

## 7. ESD Characteristics

Parameters	Symbol	Norm	Value	Unit
ESD level HBM (Human Body Model)	VHBM	ANSI/ESD STM.5.1-2001	2500	V
ESD level MM (Machine Machine Model)	VMM	EIA/JESD22 A115 A	250	V
ESD level CDM (Charged Device Model)	VCDM	ESD STM.5.3.1-1999	1250	V

## 8. Electrical Characteristics

No.	Parameters	Test Conditions	Pin	Symbol	Min.	Typ.	Max.	Unit	Type*
<b>1</b>	<b>Common</b>								
1.1	Analog supply current <sup>(1)</sup>	$V_{PUxto} = V_{PUrf} = V_{PU,on}$	7, 19	$I_S$		14.2		mA	A
1.2	Digital supply current <sup>(1),(2)</sup>	$V_{PUxto} = V_{PUrf} = V_{PU,on}$	1	$I_{DIG}$		700		$\mu$ A	A
1.3	Analog supply current in XTO mode <sup>(1)</sup>	$V_{PUxto} = V_{PU,on}$ , $V_{PUrf} = V_{PU,off}$	7, 19	$I_{S\_XTO}$		2.9		mA	A
