BOARD LAYOUT:

POWER SUPPLY CIRCUIT:

Power should be applied to CON2PV2-2.5MM connector. AVR-CAN could be powered by applying up to 12VDC (7 to 12 VDC) to EXT1-1 and EXT1-2 and GND to EXT1-3 and EXT1-4 or if you supply 7 to 12 VDC to CON2PV2-2.5MM pin 2 (VIN) and GND to CON2PV2-2.5MM pin 1.

The consumption of AVR-CAN is about 40-50 mA.

RESET CIRCUIT:

AVR-CAN reset circuit is made with R6 (10k) pull-up and button RST. On the board there is a place for the voltage supervisory device MCP120-T, but we sell it without MCP120-T.

CLOCK CIRCUIT:

Quartz crystal 16 MHz is connected to **AT90CAN128** pin 24 (XTAL1) and pin 23 (XTAL2).

Quartz crystal 32.768 kHz is connected to **AT90CAN128** pin 19 (TOSC1/PG4) and pin 18 (TOSC2/PG3) and supplies the internal Asynchronous Timer/Counter (Timer/Counter2 in asynchronous operation).

JUMPER DESCRIPTION:

CAN_D

CAN Disable. If this jumper is closed, the CAN is disabled.
Default state is open.

CAN_T

This jumper assures correct work of the CAN. At each end of the bus it should be closed. This means that if you have only two devices with CAN, the jumpers of both devices should be closed. If you have more than two devices, only the two end-devices should be closed.
Default state is closed.

AVREF_E

This jumper when closed supplies VDDA reference to the AVREF. If this jumper is open the desired reference voltage should be applied at EXT2-3.
Default state is open.

INPUT/OUTPUT:

Status LED (red) with name **STAT** connected to **AT90CAN128** pin 6 (OC3B/INT4/PE4).

Power-on LED (red) with name **PWR_LED** - this LED shows that +5V is applied to the board.

User button with name **BUT** connected to **AT90CAN128** pin 7 (OC3C/INT5/PE5).

Reset button with name **RST** connected to **AT90CAN128** pin 20 (#RESET).
