

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# Advanced Multi-channel Single Chip UHF Transceiver

#### **OVERVIEW**

The AX5042 is a true single chip low-power CMOS transceiver primarily for use in SRD bands. The on-chip transceiver consists of a fully integrated RF front-end with modulator and demodulator. Base band data processing is implemented in an advanced and flexible communication controller that enables user friendly communication via the SPI interface or in direct wire mode.

#### **Features**

- Advanced Multi-channel Single Chip UHF Transceiver
- Configurable for Usage in 400–470 (510) MHz and 800–940 (1020) MHz ISM Bands
- Wide Variety of Shaped Modulations Supported in RX and TX (ASK, PSK, OQPSK, MSK, FSK, GFSK)
- Data Rates from 1 to 250 kbps (FSK, MSK, GFSK, GMSK, OQPSK) and 2 to 600 kbps (ASK, PSK) with Fully Scaling Narrow-band Channel Filtering
- 4.8 kHz to 600 kHz Programmable Channel Filter
- Ultra Fast Settling RF Frequency Synthesizer for Low-power Consumption
- 802.15.4 Compatible
- RS-232 (UART) Compatible
- RF Carrier Frequency and FSK Deviation Programmable in 1 Hz Steps
- Fully Integrated Frequency Synthesizer with VCO Auto-ranging and Band-width Boost Modes for Fast Locking
- Few External Components
- On-chip Communication Controller and Flexible Digital Modem
- Channel Hopping up to 2000 hops/s
- Sensitivity down to −123 dBm @ 1.2 kbps FSK
- Sensitivity down to -115 dBm @ 10 kbps FSK
- Up to +10 dBm (+13 dBm 433 MHz) Programmable Transmitter Power Amplifier for Long Range Operation
- Crystal Oscillator with Programmable
   Transconductance for Low Cost Crystals (a TCXO is recommended for Channel Filter BW < 40 kHz)</p>
- Automatic Frequency Control (AFC)
- SPI Micro-controller Interface
- Digital RSSI with 0.625 dB Resolution
- Fully Integrated Current/Voltage References

QFN28 5x5, 0.5P CASE 485EF

#### **ORDERING INFORMATION**

| Device        | Туре        | Qty   |
|---------------|-------------|-------|
| AX5042-1-TA05 | Tape & Reel | 500   |
| AX5042-1-TW30 | Tape & Reel | 3,000 |

- Wire and Frame Mode
- QFN28 Package
- Low Power 17 23 mA at 2.5 V Supply during Receive and 13 – 37 mA during Transmit
- 24 Bit RX/TX FIFO
- 2.3 V to 2.8 V Supply Range
- Programmable Cyclic Redundancy Check (CRC-CCITT, CRC-16, CRC-32)
- Optional Spectral Shaping Using a Self Synchronized Shift Register
- RoHS Compliant

# **Applications**

400–470 MHz and 800–940 MHz data transmission and reception in the Short Range Device (SRD) band. The frequency range up to 510 MHz and 1020 MHz is accessible with higher VDD limit.

- Automatic Meter Reading
- FCC Part 90.210 6.25 kHz, 12.5 kHz and 25 kHz Applications
- EN 300 220 V 2.1.1

1

- European Paging Applications
- Long Range Sensor Read-out
- Long Range Remote Controls

# **BLOCK DIAGRAM**

Figure 1. Functional Block Diagram of the AX5042

**Table 1. PIN FUNCTION DESCRIPTIONS** 

| Symbol   | Pin(s) | Туре | Description   |
|----------|--------|------|---|
| NC       | 1      | N    | Not to be connected   |
| VDD      | 2      | Р    | Power supply  |
| GND      | 3      | G    | Ground  |
| ANTP     | 4      | А    | Antenna input/output  |
| ANTN     | 5      | Α    | Antenna input/output  |
| GND      | 6      | Р    | Ground  |
| VDD      | 7      | Р    | Power supply  |
| NC       | 8      | N    | Not to be connected   |
| LPFILT   | 9      | A    | Pin for optional external synthesizer loop filter; leave unconnected if not used It is recommended to use the internal loop filter  |
| NC       | 10     | N    | Not to be connected   |
| GND      | 11     | Р    | Ground  |
| RESET_N  | 12     | I    | Optional reset input. If not used this pin must be connected to VDD.  |
| SYSCLK   | 13     | I/O  | Default functionality: Crystal oscillator (or divided) clock output Can be programmed to be used as a general purpose I/O pin   |
| SEL      | 14     | I    | Serial peripheral interface select  |
| CLK      | 15     | I    | Serial peripheral interface clock   |
| MISO     | 16     | 0    | Serial peripheral interface data output   |
| MOSI     | 17     | I    | Serial peripheral interface data input  |
| DATA     | 18     | I/O  | In wire mode: Data input/output Can be programmed to be used as a general purpose I/O pin   |
| IRQ_TXEN | 19     | I/O  | In frame mode: Interrupt request output In wire mode: Transmit enable input Can be programmed to be used as a general purpose I/O pin   |
| VDD      | 20     | Р    | Power supply  |
| DCLK     | 21     | I/O  | In wire mode: Clock output Can be programmed to be used as a general purpose I/O pin  |
| GND      | 22     | Р    | Ground  |
| PWRUP    | 23     | I/O  | Power-up/-down input; activates/deactivates analog blocks Can be programmed to be used as a general purpose I/O pin If the power-up/-down functionality is handled in software and no usage as general purpose I/O pin is planned then this pin should be tied to VDD |
| NC       | 24     | N    | Not to be connected   |
| NC       | 25     | N    | Not to be connected   |
| VDD      | 26     | Р    | Power supply  |
| CLK16P   | 27     | А    | Crystal oscillator input/output   |
| CLK16N   | 28     | А    | Crystal oscillator input/output   |

A = analog signal

I = digital input signal

O = digital output signal

I/O = digital input/output signal

N = not to be connected

P = power or ground

All digital inputs are Schmitt trigger inputs, digital input and output levels are LVCMOS/LVTTL compatible and 3.3 V / 5 V tolerant.

The center pad of the QFN28 package should be connected to GND.

**Table 2. ABSOLUTE MAXIMUM RATINGS** 

| Symbol           | Description                                    | Condition | Min   | Max         | Units |
|------------------|--|-----------|-------|-------------|-------|
| VDD              | Supply voltage                                 |           | -0.5  | 2.8         | V     |
| IDD              | Supply current                                 |           |       | 50          | mA    |
| P <sub>tot</sub> | Total power consumption                        |           |       | 800         | mW    |
| P <sub>I</sub>   | Absolute maximum input power at receiver input |           |       | 15          | dBm   |
| I <sub>I1</sub>  | DC current into any pin except ANTP, ANTN      |           | -10   | 10          | mA    |
| I <sub>I2</sub>  | DC current into pins ANTP, ANTN                |           | -100  | 100         | mA    |
| I <sub>O</sub>   | Output current                                 |           |       | 40          | mA    |
| V <sub>ia</sub>  | Input voltage ANTP, ANTN pins                  |           | -0.5  | VDD + 2.0 V | V     |
|                  | Input voltage digital pins                     |           | -0.5  | VDD + 3 V   | V     |
| V <sub>es</sub>  | Electrostatic handling                         | НВМ       | -2000 | 2000        | V     |
| T <sub>amb</sub> | Operating ambient temperature                  |           | -40   | 85          | °C    |
| T <sub>stg</sub> | Storage temperature                            |           | -65   | 150         | °C    |
| T <sub>j</sub>   | Junction temperature                           |           |       | 150         | °C    |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

<sup>1.</sup> Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

|                    |                                 | 868 MHz, 4 dBm  |     | 23  |     |       |
|                    |                                 | 868 MHz, 0 dBm  |     | 19  |     |       |
|                    |                                 | 868 MHz, –12 dBm  |     | 13  |     |       |
|                    |                                 | 433 MHz, 12 dBm   |     | 37  |     |       |
|                    |                                 | 433 MHz, 6 dBm  |     | 24  |     |       |
|                    |                                 | 433 MHz, 2 dBm  |     | 20  |     |       |
|                    |                                 | 433 MHz, –8 dBm   |     | 13  |     |       |

<sup>1.</sup> Low power mode requires reprogramming of the device reference current (REF\_I) as well as the synthesizer VCO current (VCO\_I) and there are trade-offs with the lowest achievable power supply value as well as with sensitivity. Sensitivities and operating conditions in this data-sheet do not refer to low power mode.

|                    |                             | XTALOSCGM = 1101         |     | 10   |     |       |
|                    |                             | XTALOSCGM = 1110         |     | 10.5 |     |       |
|                    |                             | XTALOSCGM = 1111         |     | 11   |     |       |
| f <sub>ext</sub>   | External clock input        | (Note 2)                 |     | 16   |     | MHz   |
| RIN <sub>osc</sub> | Input impedance             |                          | 10  |      |     | kΩ    |
| CIN <sub>osc</sub> | Input capacitance           |                          |     |      | 4   | pF    |

Tolerances and start-up times will depend on the crystal used. Depending on the RF frequency and channel spacing the IC must be calibrated to the exact crystal frequency using the readings of the register TRKFREQ
 External clock should be input via an AC coupling at pin CLK16P with the oscillator powered up

# Table 6. RF FREQUENCY GENERATION SUBSYSTEM (SYNTHESIZER)

| Symbol                 | Description   | Condition   | Min | Тур  | Max | Units  |
|------------------------|---|---|-----|------|-----|--------|
| f <sub>REF</sub>       | Reference frequency   |   |     | 16   |     | MHz    |
| f <sub>range_hi</sub>  | Frequency range   | BANDSEL = 0   | 800 |      | 930 | MHz    |
| f <sub>range_low</sub> |   | BANDSEL = 1   | 400 |      | 470 | MHz    |
| f <sub>RESO</sub>      | Frequency resolution  |   | 1   |      |     | Hz     |
| BW <sub>1</sub>        | Synthesizer loop bandwidth  Internal loop filter, pin LPFILT                    | Loop filter configuration: FLT = 01<br>Charge pump current: PLLCPI = 111<br>default |     | 100  |     | kHz    |
| BW <sub>2</sub>        | is unconnected  | Loop filter configuration: FLT = 01<br>Charge pump current: PLLCPI = 001            |     | 50   |     |        |
| BW <sub>3</sub>        |   | Loop filter configuration: FLT = 11<br>Charge pump current: PLLCPI = 111            |     | 200  |     |        |
| BW <sub>4</sub>        |   | Loop filter configuration: FLT = 10<br>Charge pump current: PLLCPI = 111            |     | 500  |     |        |
| T <sub>set1</sub>      | Synthesizer settling time for 1 MHz step as typically                           | Loop filter configuration: FLT = 01<br>Charge pump current: PLLCPI = 111            |     | 15   |     | μs     |
| T <sub>set2</sub>      | required for RX/TX switching  Internal loop filter, pin LPFILT                  | Loop filter configuration: FLT = 01<br>Charge pump current: PLLCPI = 001            |     | 30   |     |        |
| T <sub>set3</sub>      | is unconnected  | Loop filter configuration: FLT = 11<br>Charge pump current: PLLCPI = 111            |     | 7    |     |        |
| T <sub>set4</sub>      |   | Loop filter configuration: FLT = 10<br>Charge pump current: PLLCPI = 111            |     | 3    |     |        |
| T <sub>start1</sub>    | Synthesizer start-up time if<br>crystal oscillator and<br>reference are running | Loop filter configuration: FLT = 01<br>Charge pump current: PLLCPI = 111<br>default |     | 25   |     | μs     |
| T <sub>start2</sub>    | Internal loop filter, pin LPFILT is unconnected                                 | Loop filter configuration: FLT = 01<br>Charge pump current: PLLCPI = 001            |     | 50   |     |        |
| T <sub>start3</sub>    |   | Loop filter configuration: FLT = 11<br>Charge pump current: PLLCPI = 111            |     | 12   |     |        |
| T <sub>start4</sub>    |   | Loop filter configuration: FLT = 10<br>Charge pump current: PLLCPI = 111            |     | 5    |     |        |
| PN1 <sub>868</sub>     | Synthesizer phase noise   | 868 MHz; 50 kHz from carrier  |     | -77  |     | dBc/Hz |
|                        | Loop filter configuration:<br>FLT = 01  | 868 MHz; 100 kHz from carrier   |     | -75  |     |        |

|                     | Adjacent channel suppression     | PSK 200 kbps; (Notes 1 & 6)  |     | 17    |     | dB    |
|                     | Alternate channel suppression    |  |     | 28    |     |       |
| BLK <sub>868</sub>  | Blocking at ± 1 MHz offset       | FSK 4.8 kbps, (Notes 2 & 7)  |     | 43    |     | dB    |
|                     | Blocking at – 2 MHz offset       |  |     | 51    |     |       |
|                     | Blocking at ± 10 MHz offset      |  |     | 74    |     |       |
|                     | Blocking at ± 100 MHz offset     |  |     | 82    |     |       |
| IMRR <sub>868</sub> | Image rejection                  |  |     | 25    |     | dB    |

<sup>1.</sup> Interferer/Channel @ BER = 10<sup>-3</sup>, channel level is +10 dB above the typical sensitivity, the interfering signal is a random data signal (except PSK200); both channel and interferer are modulated without shaping

- 2. FSK 4.8 kbps: 868 MHz, 20 kHz channel spacing, 2.4 kHz deviation, programming as recommended in Programming Manual
- 3. FSK 12.5 kbps: 868 MHz, 50 kHz channel spacing, 6.25 kHz deviation, programming as recommended in Programming Manual 4. FSK 50 kbps: 868 MHz, 200 kHz channel spacing, 25 kHz deviation, programming as recommended in Programming Manual

- 5. FSK 100 kbps: 868 MHz, 400 kHz channel spacing, 50 kHz deviation, programming as recommended in Programming Manual 6. PSK 200 kbps: 868 MHz, 400 kHz channel spacing, programming as recommended in Programming Manual, interfering signal is a constant
- 7. Channel/Blocker @ BER = 10<sup>-3</sup>, channel level is +10 dB above the typical sensitivity, the blocker signal is a constant wave; channel signal is modulated without shaping, the image frequency lies 2 MHz above the wanted signal

**Table 10. SPI TIMING**

For a figure showing the wire mode interface timing parameters see section Wire Mode Interface.

#### CIRCUIT DESCRIPTION

The AX5042 is a true single chip low-power CMOS transceiver primarily for use in SRD bands. The on-chip transceiver consists of a fully integrated RF front-end with modulator and demodulator. Base band data processing is implemented in an advanced and flexible communication controller that enables user friendly communication via the SPI interface or in direct wire mode.

AX5042 can be operated from 2.3 V to 2.8 V power supply over a temperature range from  $-40^{\circ}$ C to 85°C, it consumes 13 – 37 mA for transmitting depending on data mode and output power and 17 – 23 mA for receiving.

The AX5042 features make it an ideal interface for integration into various battery powered SRD solutions such as ticketing or as transceiver for telemetric applications e.g. in sensors. As primary application, the transceiver is intended for UHF radio equipment in accordance with the European Telecommunication Standard Institute (ETSI) specification EN 300 220–1 and the US Federal Communications Commission (FCC) standard CFR47, part 15. The use of AX5042 in accordance to FCC Par 15.247, allows for improved range in the 915 MHz band. Additionally AX5042 is compatible with the low frequency standards of 802.15.4 (ZigBee).

The AX5042 can be operated in two fundamentally different modes.

In wire mode the IC behaves as an extension of any wire. The internal communication controller is disabled and the modem data is directly available on a dedicated pin (DATA). The bit clock is also output on a dedicated pin (DCLK). In this mode the user can connect the data pin to any port of a micro-controller or to a UART, but has to control coding, checksums, pre and post ambles. The user can choose between synchronous and asynchronous wire mode, asynchronous wire mode performs RS232 start bit recognition and re-synchronization for transmit.

In **frame mode** data is sent and received via the SPI port in frames. Pre– and postambles as well as checksums can be generated automatically. Interrupts control the data flow between a micro–controller and the AX5042.

Both modes can be used both for transmit and receive. In both cases the AX5042 behaves as a SPI slave interface. Configuration of the AX5042 is always done via the SPI interface.

AX5042 supports any data rate from 1.2 kbps to 250 kbps for FSK, GFSK, GMSK, MSK and from 2 kbps to 600 kbps for ASK and PSK. To achieve optimum performance for specific data rates and modulation schemes several register settings to configure the AX5042 are necessary, they are outlined in the following, for details see the AX5042 Programming Manual.

Spreading and despreading is possible on all data rates and modulation schemes. The net transfer rate is reduced by a factor of 15 in this case. For 802.15.4 either 600 or 300 kbps modes have to be chosen.

The receiver supports multi-channel operation for all data rates and modulation schemes.

### **Crystal Oscillator**

The on-chip crystal oscillator allows the use of an inexpensive quartz crystal as the RF generation subsystem's timing reference. Although a wider range of crystal frequencies can be handled by the crystal oscillator circuit, it is recommended to use 16 MHz as reference frequency since this choice allows all the typical SRD band RF frequencies to be generated.

The oscillator circuit is enabled by programming the PWRMODE register. After reset the oscillator is enabled.

To adjust the circuit's characteristics to the quartz crystal being used without using additional external components the transconductance of the crystal oscillator can be programmed.

The transconductance is programmed via register bits XTALOSCGM[3:0] in register XTALOSC.

The recommended method to synchronize the receiver frequency to a carrier signal is to make use of the high resolution RF frequency generation subsystem together with the Automatic Frequency Control, both are described further down.

Alternatively a single ended reference (TXCO, CXO) may be used. The CMOS levels should be applied to pin CLK16P via an AC coupling with the crystal oscillator enabled.

#### **SYSCLK Output**

The SYSCLK pin outputs the reference clock signal divided by a programmable integer. Divisions from 1 to 2048 are possible. For divider ratios > 1 the duty cycle is 50%. Bits SYSCLK[3:0] in the PINCFG1 register set the divider ratio. The SYSCLK output can be disabled.

Outputting a frequency that is identical to the IF frequency (default 1 MHz) on the SYSCLK pin is not recommended during receive operation, since it requires extensive decoupling on the PCB to avoid interference.

#### **PWRUP Input**

The PWRUP pin disables all analog blocks when it is pulled low. If the pin is pulled high, then the power-up state of the analog blocks can be handled fully in software by programming register PWRMODE. It is recommended to connect PWRUP to VDD.

#### **RESET\_N Input**

The AX5042 can be reset in two ways:

- 1. By SPI accesses: the bit RST in the PWRMODE register is toggled.
- 2. Via the RESET\_N pin: A low pulse is applied at the RESET\_N pin. With the rising edge of RESET\_N the device goes into its operational

A reset must be applied after power-up. It is safe to perform this power-on reset using a SPI access, so using the RESET\_N pin is strictly optional. If the RESET\_N pin is not used it must be tied to VDD.

#### **DATA Input/Output and DCLK Output**

The DATA input/output pin is used for data transfer from and to AX5042 in wire mode.

The transfer direction of data is set by programming the PWRMODE register or by the level applied to the pin  $IRQ_TXEN$  (1 = TX, then DATA is an input pin; 0 = RX, then DATA is an output pin).

The DCLK output pin supplies the corresponding data clock which depends on the data-rate settings programmed to AX5042. In synchronous wire mode a connected micro-controller must receive or supply data on the DATA pin synchronous to the clock available the DCLK pin. In asynchronous wire mode, the receive/transmit clock is still available on the DCLK pin, but its usage is optional.

If frame mode is used for data communication, the pins DCLK and DATA can optionally be used as general purpose I/O pins.

### **RF Frequency Generation Subsystem**

The RF frequency generation subsystem consists of a fully integrated synthesizer, which multiplies the reference frequency from the crystal oscillator to get the desired RF frequency. The advanced architecture of the synthesizer enables frequency resolutions of 1 Hz, as well as fast settling times of  $5-50~\mu s$  depending on the settings (see section: AC Characteristics). Fast settling times mean fast start–up, which enables low–power system design.

For receive operation the RF frequency is fed to the mixer, for transmit operation to the power-amplifier.

The frequency must be programmed to the desired carrier frequency. The RF frequency shift by the IF frequency that is required for RX operation, is automatically set when the receiver is activated and does not need to be programmed by the user. The default IF frequency is 1 MHz. It can be programmed to other values. Changing the IF frequency and thus the center frequency of the digital channel filter can be used to adapt the blocking performance of the device to specific system requirements.

The synthesizer loop bandwidth can be programmed, this serves three purposes:

- 1. Start-up time optimization, start-up is faster for higher synthesizer loop bandwidths.
- TX spectrum optimization, phase-noise at 300 kHz to 1 MHz distance from the carrier improves with lower synthesizer loop bandwidths.
- 3. Adaptation of the bandwidth to the data-rate. For transmission of FSK, GFSK and MSK it is required that the synthesizer bandwidth must be in the order of the data-rate.

#### VCO

An on-chip VCO converts the control voltage generated by the charge pump and loop filter into an output frequency. This frequency is used for transmit as well as for receive operation. The frequency can be programmed in 1 Hz steps in the FREQ registers. For operation in the 433 MHz band, the BANDSEL bit in the PLLLOOP register must be programmed.

# VCO Auto-Ranging

The AX5042 has an integrated auto-ranging function, which allows to set the correct VCO range for specific frequency generation subsystem settings automatically. Typically it has to be executed after power-up. The function is initiated by setting the RNG\_START bit in the PLLRANGING register. The bit is readable and a 0 indicates the end of the ranging process. If the bit RNGERR is 0, then the auto-ranging has been executed successfully.

#### Loop Filter and Charge Pump

The AX5042 internal loop filter configuration together with the charge pump current sets the synthesizer loop band width. The loop-filter has three configurations that can be programmed via the register bits FLT[1:0] in register PLLLOOP, the charge pump current can be programmed using register bits PLLCPI[2:0] also in register PLLLOOP. Synthesizer bandwidths are typically 50 – 500 kHz depending on the PLLLOOP settings, for details see the section: AC Characteristics.

Registers

**Table 12. REGISTERS** 

| Register   | Bits     | Purpose   |  |  |  |  |  |
|--|----------|---|--|--|--|--|--|
| PLLLOOP  | FLT[1:0] | Synthesizer loop filter bandwidth, recommended usage is to increase the bandwidth for faster settling time, bandwidth increases of factor 2 and 5 are possible. |  |  |  |  |  |
| PLLCPI[2:0] Synthesizer charge pump current, recommended usage is to decrease the band improve the phase–noise) for low data–rate transmissions. |          |   |  |  |  |  |  |
|  | BANDSEL  | Switches between 868 MHz / 915 MHz and 433 MHz bands  |  |  |  |  |  |
| FREQ   | •        | Programming of the carrier frequency  |  |  |  |  |  |
| IFFREQHI, IFFREQ   | QLO      | Programming of the IF frequency   |  |  |  |  |  |
| PLLRANGING   |          | Initiate VCO auto-ranging and check results   |  |  |  |  |  |

#### RF Input and Output Stage (ANTP/ANTN)

The AX5042 uses fully differential antenna pins. RX/TX switching is handled internally, an external RX/TX switch is not required.

#### LNA

The LNA amplifies the differential RF signal from the antenna and buffers it to drive the I/Q mixer. An external matching network is used to adapt the antenna impedance to the IC impedance. A DC feed to the supply voltage VDD must be provided at the antenna pins. For recommendations see section: Application Information.

#### I/Q Mixer

The RF signal from the LNA is mixed down to an IF of typically 1 MHz. I– and Q–IF signals are buffered for the analog IF filter.

#### PA

In TX mode the PA drives the signal generated by the frequency generation subsystem out to the differential antenna terminals. The output power of the PA is programmed via bits TXRNG[3:0] in the register TXPWR. Output power as well as harmonic content will depend on the external impedance seen by the PA, recommendations are given in the section: Application Information.

#### **Analog IF Filter**

The mixer is followed by a complex band-pass IF filter, which suppresses the down-mixed image while the wanted signal is amplified. The centre frequency of the filter is 1 MHz, with a passband width of 1 MHz. The RF frequency generation subsystem must be programmed in such a way that for all possible modulation schemes the IF frequency spectrum fits into the passband of the analog filter.

#### **Digital IF Channel Filter and Demodulator**

The digital IF channel filter and the demodulator extract the data bit-stream from the incoming IF signal. They must be programmed to match the modulation scheme as well as the bit rate. Inaccurate programming will lead to loss of sensitivity.

The channel filter offers bandwidths of 4.8 kHz up to 600 kHz. Data-rates down to 1.2 kbit/s can be demodulated, but sensitivities will not increase significantly vs. 4.8 kbit/s.

For detailed instructions how to program the digital channel filter and the demodulator see the AX5042 Programming Manual, an overview of the registers involved is given in the following table. The register setups typically must be done once at power-up of the device.

**Table 13. REGISTERS** 

| Register                                    | Remarks  |
|---|--|
| CICDECHI, CICDECLO                          | This register programs the bandwidth of the digital channel filter.  |
| DATARATEHI, DATARATELO                      | These registers specify the receiver bit rate, relative to the channel filter bandwidth.   |
| TMGGAINHI, TMGGAINLO                        | These registers specify the aggressiveness of the receiver bit timing recovery. More aggressive settings allow the receiver to synchronize with shorter preambles, at the expense of more timing jitter and thus a higher bit error rate at a given signal-to-noise ratio. |
| MODULATION                                  | This register selects the modulation to be used by the transmitter and the receiver, i.e. whether ASK, PSK, FSK, MSK, GFSK, GMSK or OQPSK should be used.  |
| PHASEGAIN, FREQGAIN,<br>FREQGAIN2, AMPLGAIN | These registers control the bandwidth of the phase, frequency offset and amplitude tracking loops. Recommended settings are provided in the Programming Manual.  |
| AGCATTACK, AGCDECAY                         | These registers control the AGC (automatic gain control) loop slopes, and thus the speed of gain adjustments. The faster the bit rate, the faster the AGC loop should be. Recommended settings are provided in the Programming Manual.                                     |
| TXRATE                                      | These registers control the bit rate of the transmitter.   |
| FSKDEV                                      | These registers control the frequency deviation of the transmitter in FSK mode. The receiver does not explicitly need to know the frequency deviation, only the channel filter bandwidth has to be set wide enough for the complete modulation to pass.                    |

#### Encoder

The encoder is located between the Framing Unit, the Demodulator and the Modulator. It can optionally transform the bit-stream in the following ways:

- It can invert the bit stream.
- It can perform differential encoding. This means that a
  zero is transmitted as no change in the level, and a one
  is transmitted as a change in the level. Differential
  encoding is useful for PSK, because PSK transmissions
  can be received either as transmitted or inverted, due to
- the uncertainty of the initial phase. Differential encoding / decoding removes this uncertainty.
- It can perform Manchester encoding. Manchester
  encoding ensures that the modulation has no DC
  content and enough transitions (changes from 0 to 1 and
  from 1 to 0) for the demodulator bit timing recovery to
  function correctly, but does so at a doubling of the data
  rate.
- It can perform Spectral Shaping. Spectral Shaping removes DC content of the bit stream, ensures

transitions for the demodulator bit timing recovery, and makes sure that the transmitted spectrum does not have discrete lines even if the transmitted data is cyclic. It does so without adding additional bits, i.e. without changing the data rate. Spectral Shaping uses a self synchronizing feedback shift register.

The encoder is programmed using the register ENCODING, details and recommendations on usage are given in the AX5042 Programming Manual.

#### Framing and FIFO

Most radio systems today group data into packets. The framing unit is responsible for converting these packets into a bit-stream suitable for the modulator, and to extract packets from the continuous bit-stream arriving from the demodulator.

The Framing unit supports three different modes:

- HDLC
- Raw
- 802.15.4 Compliant

The micro-controller communicates with the framing unit through a 3 level  $\times$  10 bit FIFO. The FIFO decouples micro-controller timing from the radio (modulator and demodulator) timing. The bottom 8 bit of the FIFO contain transmit or receive data. The top 2 bit are used to convey meta information in HDLC and 802.15.4 modes. They are unused in Raw mode. The meta information consists of packet begin / end information and the result of CRC checks.

The AX5042 contains one FIFO. Its direction is switched depending on whether transmit or receive mode is selected.

The FIFO can be operated in polled or interrupt driven modes. In polled mode, the micro-controller must periodically read the FIFO status register or the FIFO count register to determine whether the FIFO needs servicing.

In interrupt mode EMPTY, NOT EMPTY, FULL, NOT FULL and programmable level interrupts are provided. The AX5042 signals interrupts by asserting (driving high) its IRQ\_TXEN line. The interrupt line is level triggered, active high. The IRQ line polarity can be inverted by programming register PINCFG2. Interrupts are acknowledged by removing the cause for the interrupt, i.e. by emptying or filling the FIFO.

Basic FIFO status (EMPTY, FULL, Overrun, Underrun, and the top two bits of the top FIFO word) are also provided during each SPI access on MISO while the micro-controller shifts out the register address on MOSI. See the SPI interface section for details. This feature significantly reduces the number of SPI accesses necessary during transmit and receive.

HDLC Mode

NOTE: HDLC mode follows High-Level Data Link Control (HDLC, ISO 13239) protocol.

HDLC Mode is the main framing mode of the AX5042. In this mode, the AX5042 performs automatic packet delimiting, and optional packet correctness check by inserting and checking a cyclic redundancy check (CRC) field

The packet structure is given in the following table.

Table 14.

| Flag  | Address | Control     | Information                                       | FCS         | (Optional Flag) |
|-------|---------|-------------|---|-------------|-----------------|
| 8 bit | 8 bit   | 8 or 16 bit | Variable length, 0 or more bits in multiples of 8 | 16 / 32 bit | 8 bit           |

HDLC packets are delimited with flag sequences of content 0x7E.

In AX5042 the meaning of address and control is user defined. The Frame Check Sequence (FCS) can be programmed to be CRC-CCITT, CRC-16 or CRC-32.

The receiver checks the CRC, the result can be retrieved from the FIFO, the CRC is appended to the received data.

For details on implementing a HDLC communication see the AX5042 Programming Manual.

Raw Mode

In Raw mode, the AX5042 does not perform any packet delimiting or byte synchronization. It simply serialises transmit bytes and de-serializes the received bit-stream and groups it into bytes.

This mode is ideal for implementing legacy protocols in software.

802.15.4 (ZigBee) DSSS

802.15.4 uses binary phase shift keying (PSK) with 300 kbit/s (868 MHz band) or 600 kbit/s (915 MHz band) on the radio. The usable bit rate is only a 15<sup>th</sup> of the radio bit rate, however. A spreading function in the transmitter expands the user bit rate by a factor of 15, to make the transmission more robust. The despreader function of the receiver undoes that.

In 802.15.4 mode, the AX5042 framing unit performs the spreading and despreading function according to the 802.15.4 specification. In receive mode, the framing unit will also automatically search for the 802.15.4 preamble, meaning that no interrupts will have to be serviced by the micro-controller until a packet start is detected.

The 802.15.4 is a universal DSSS mode, which can be used with any modulation or data rate as long as it does not violate the maximum data rate of the modulation being used. Therefore the maximum DSSS data rate is 16 kbps for FSK and 40 kbps for ASK and PSK.

#### **RX AGC and RSSI**

AX5042 features two receiver signal strength indicators (RSSI):

- 1. RSSI before the digital IF channel filter.

  The gain of the receiver is adjusted in order to keep the analog IF filter output level inside the working range of the ADC and demodulator. The register AGCCOUNTER contains the current value of the AGC and can be used as an RSSI. The step size of this RSSI is 0.625 dB. The value can be used as soon as the RF frequency generation sub–system has been programmed.
- RSSI behind the digital IF channel filter.The demodulator also provides amplitude

information in the TRKAMPL register. By combining both the AGCCOUNTER and the TRKAMPL registers, a high resolution (better than 0.1 dB) RSSI value can be computed at the expense of a few arithmetic operations on the micro–controller. Formulas for this computation can be found in the AX5042 Programming Manual.

#### Modulator

Depending on the transmitter settings the modulator generates various inputs for the PA (see Table 15):

Table 15.

| Modulation   | Modulation Bit = 0          |                             | Main Lobe Bandwidth   | Max. Bit Rate |  |
|--------------|-----------------------------|-----------------------------|-----------------------|---------------|--|
| ASK          | PA off                      | PA on                       | BW = BITRATE          | 600 kBit/s    |  |
| FSK/MSK/GFSK | $\Delta f = -f_{deviation}$ | $\Delta f = +f_{deviation}$ | BW = (1 + h) ·BITRATE | 250 kBit/s    |  |
| PSK          | $\Delta\Phi$ = 0°           | $\Delta\Phi$ = 180°         | BW = BITRATE          | 600 kBit/s    |  |

h = modulation index. It is the ratio of the deviation compared to the bit-rate;  $f_{deviation} = 0.5 \cdot h \cdot BITRATE, AX5042 \ can demodulate signals with h < 4$ 

ASK = amplitude shift keying FSK = frequency shift keying

MSK = minimum shift keying; MSK is a special case of FSK, where h = 0.5, and therefore fdeviation = 0.25·BITRATE; the advantage of

 $f_{deviation} = 0.25 \cdot BITRATE$ ; the advantage of MSK over FSK is that it can be demodulated more robustly.

GFSK = gaussian frequency shift keying, same as FSK

but shaped, BT = 0.3

GMSK = GFSK with h = 0.5PSK = phase shift keying OQPSK = offset quadrature shift keying. The AX5042 supports OQPSK. However, unless compatibility to an existing system is required, MSK should be preferred.

All modulation schemes are binary.

#### **Automatic Frequency Control (AFC)**

The AX5042 has a frequency tracking register TRKFREQ to synchronize the receiver frequency to a carrier signal. For AFC adjustment, the frequency offset can be computed with the following formula:

$$\Delta f = \frac{TRKFREQ}{2^{16}} \cdot BITRATE$$

## **PWRMODE Register**

The operation sequencies of the chip can be controlled using the PWRMODE and APEOVER registers.

**Table 16. PWRMODE REGISTER** 

| PWRMODE<br>Register | APEOVER<br>Register | Name      | Description  | Typical Idd              |
|---------------------|---------------------|-----------|--|--------------------------|
| 0x00                | 0x80                | POWERDOWN | All digital and analog functions, except the register file, are disabled. SPI registers are still accessible.  | 0.5 μΑ                   |
| 0x60                | 0x00                | STANDBY   | The crystal oscillator is powered on; receiver and transmitter are off.  | 650 μΑ                   |
| 0x00                | =                   |           |  |                          |
| 0x61                | 0x00                | PWRUPPIN  | The mode is determined by the state of the PWRUP and IRQ_TXEN pins.  PWRUP = 0: Same function as POWERDOWN   | 0.5 μΑ                   |
| 0x01                |                     |           | PWRUP = 1, IRQ_TXEN = 0: Same function as FULLRX<br>PWRUP = 1, IRQ_TXEN = 1: Same function as FULLTX   | 17 – 21 mA<br>13 – 37 mA |
| 0x68                | 0x00                | SYNTHRX   | The synthesizer is running on the receive frequency. Transmitter and receiver are still off. This mode is used to let the synthesizer settle on the correct frequency for receive. | 12 mA                    |

**Table 16. PWRMODE REGISTER** 

| PWRMODE<br>Register | APEOVER<br>Register | Name    | Description  | Typical Idd |
|---------------------|---------------------|---------|--|-------------|
| 0x69                | 0x00                | FULLRX  | Synthesizer and receiver are running   | 17 – 21 mA  |
| 0x6C                | 0x00                | SYNTHTX | The synthesizer is running on the transmit frequency. Transmitter and receiver are still off. This mode is used to let the synthesizer settle on the correct frequency for transmit.                                   | 11 mA       |
| 0x6D                | 0x00                | FULLTX  | Synthesizer and transmitter are running. Do not switch into this mode before the synthesizer has completely settled on the transmit frequency (in SYNTHTX mode), otherwise spurious spectral transmissions will occur. | 13 – 37 mA  |

#### Table 17. A TYPICAL PWRMODE AND APEOVER SEQUENCE FOR A TRANSMIT SESSION

| Step | PWRMODE<br>APEOVER | Remarks   |
|------|--------------------|---|
| 1    | POWERDOWN          |   |
| 2    | STANDBY            | The settling time is dominated by the crystal used, typical value 3 ms.                             |
| 3    | SYNTHTX            | The synthesizer settling time is $5-50~\mu s$ depending on settings, see section AC Characteristics |
| 4    | FULLTX             | Data transmission   |
| 5    | POWERDOWN          |   |

### Table 18. A TYPICAL PWRMODE AND APEOVER SEQUENCE FOR A RECEIVE SESSION

| Step | PWRMODE<br>APEOVER | Remarks   |
|------|--------------------|---|
| 1    | POWERDOWN          |   |
| 2    | STANDBY            | The settling time is dominated by the crystal used, typical value 3 ms.                             |
| 3    | SYNTHRX            | The synthesizer settling time is $5-50~\mu s$ depending on settings, see section AC Characteristics |
| 4    | FULLRX             | Data reception  |
| 5    | POWERDOWN          |   |

#### **Serial Peripheral Interface**

The AX5042 can be programmed via a four wire serial interface according SPI using the pins CLK, MOSI, MISO and SEL. Registers for setting up the AX5042 are programmed via the serial peripheral interface in all device modes.

When the interface signal SEL is pulled low, a 16 bit configuration data stream is expected on the input signal pin MOSI, which is interpreted as D0...D7, A0...A6, R\_N/W. Data read from the interface appears on MISO.

Figure 3 shows a write/read access to the interface. The data stream is built of an address byte including read/write information and a data byte. Depending on the  $R_N/W$  bit and address bits A[6..0] the data D[7..0] can be written via MOSI or read at the pin MISO.

 $R_N/W = 0$  means read mode,  $R_N/W = 1$  means write mode.

The read sequence starts with 7 bits of status information S[6..0] followed by 8 data bits.

The status bits contain the following information:

Table 19.

| S6       | S5 S4     |            | S3        | S2         | S1          | S0          |
|----------|-----------|------------|-----------|------------|-------------|-------------|
| PLL LOCK | FIFO OVER | FIFO UNDER | FIFO FULL | FIFO EMPTY | FIFOSTAT(1) | FIFOSTAT(0) |

SPI Timing

Figure 3. Serial Peripheral Interface Timing

#### Wire Mode Interface

In wire mode the transmitted or received data are transferred from and to the AX5042 using the pins DATA and DCLK. DATA is an input when transmitting and an output when receiving.

The direction can be chosen by programming the PWRMODE register (recommended), or by using the IRQ\_TXEN pin.

Wire mode offers two variants: synchronous or asynchronous.

In synchronous wire mode the, the AX5042 always drives DCLK. Transmit data must be applied to DATA synchronously to DCLK, and receive data must be sampled synchronously to DCLK. Timing is given in Figure 4.

Setting the bit DCLKI in register PINCFG2 inverts the DCLK signal.

In asynchronous wire mode, a low voltage RS232 type UART can be connected to DATA. DCLK is optional in this mode. The UART must be programmed to send two stop bits, but must be able to accept only one stop bit. Both the UART data rate and the AX5042 transmit and receive bit rate must match. The AX5042 synchronizes the RS232 signal to its internal transmission clock, by inserting or deleting a stop bit.

Registers for setting up the AX5042 are programmed via the serial peripheral interface (SPI).

Wire Mode Timing

Figure 4. Wire Mode Interface Timing

#### **REGISTER BANK DESCRIPTION**

This section describes the bits of the register bank in detail. The registers are grouped by functional block to facilitate programming.

No checks are made whether the programmed combination of bits makes sense! Bit 0 is always the LSB.

NOTES: Whole registers or register bits marked as reserved should be kept at their default values.

All addresses not documented here must not be accessed, neither in reading nor in writing.

### **APPLICATION INFORMATION**

# **Typical Application Diagram**

Figure 5. Typical Application Diagram

Decoupling capacitors are not drawn. It is recommended to add 100 nF decoupling capacitor for every VDD pin. In order to reduce noise on the antenna inputs it is

recommended to add 27 pF on the VDD pins close to the antenna interface.

#### **Antenna Interface Circuitry**

The ANTP and ANTN pins provide RF input to the LNA when AX5042 is in receive mode, and RF output from the PA when AX5042 is in transmit mode. A small antenna can be connected with an optional matching network. The network must provide DC power to the PA and LNA. A biasing to VDD is necessary.

Beside biasing and impedance matching, the proposed networks also provide low pass filtering to limit spurious emission.

Single-ended Antenna Interface
